

Exhibit No.:  
Issue(s): Production Cost Modeling;  
Under-Forecasting; Net Fuel  
Cost Update  
Witness: Timothy D. Finnell  
Sponsoring Party: Union Electric Company  
Type of Exhibit: Rebuttal Testimony  
Case No.: ER-2008-0318  
Date Testimony Prepared: October 13, 2008

**MISSOURI PUBLIC SERVICE COMMISSION**

**Case No. ER-2008-0318**

**REBUTTAL TESTIMONY**

**OF**

**TIMOTHY D. FINNELL**

**ON**

**BEHALF OF**

**UNION ELECTRIC COMPANY  
d/b/a AmerenUE**

**St. Louis, Missouri  
October 2008**

## TABLE OF CONTENTS

I.	Production Cost Modeling .....	2
II.	Net Fuel Cost Update.....	9
III.	Conclusion .....	11

1 **REBUTTAL TESTIMONY**

2 **OF**

3 **TIMOTHY D. FINNELL**

4 **CASE NO. ER-2008-0318**

5 **Q. Please state your name and business address.**

6 A. My name is Timothy D. Finnell, Ameren Services Company (Ameren  
7 Services), One Ameren Plaza, 1901 Choteau Avenue, St. Louis, Missouri  
8 63103.

9 **Q. By whom and in what capacity are you employed?**

10 A. I am employed by Ameren Services as Managing Supervisor, Operations  
11 Analysis in the Corporate Planning Function of Ameren Services.

12 **Q. Are you the same Timothy D. Finnell who filed direct testimony in this**  
13 **case?**

14 A. Yes, I am.

15 **Q. What is the purpose of your rebuttal testimony?**

16 A. The purpose of my rebuttal testimony is to discuss the production cost  
17 modeling done by the Missouri Public Service Commission (MPSC) Staff to  
18 determine the normalized annual net fuel costs for this case, and to update  
19 AmerenUE's calculation of normalized annual net fuel costs. The Company's  
20 net fuel costs consist of nuclear, coal, oil, and natural gas costs associated with  
21 producing electricity from the AmerenUE generation fleet, plus the variable  
22 component of purchased power, less the energy revenues from off-system

1 sales.<sup>1</sup> As part of my rebuttal testimony, I am also updating the annual net  
2 fuel cost benefits associated with Taum Sauk Plant operations, which have  
3 changed slightly due to the updates discussed in this testimony.

4 **I. Production Cost Modeling**

5 **Q. If the Company and the MPSC Staff agreed on modeling inputs (such as**  
6 **energy prices), would you agree that the MPSC Staff’s production cost**  
7 **model would produce reasonable results for net fuel costs?**

8 A. Yes, if the Company and the Staff agreed on all modeling inputs, I believe the  
9 MPSC Staff’s production cost model, RealTime, would produce reasonable  
10 results for net fuel costs. I came to this conclusion by working with MPSC  
11 Staff witness John P. Cassidy and MPSC modeling witness Michael Rahrer.  
12 A comparison of the results from the MPSC production cost model,  
13 RealTime, and the Company’s production cost model, PROSYM, was  
14 provided in the MPSC Staff Report - Cost of Service, Section VII (D)(2)(b)  
15 Calibration of Model Results to AmerenUE (pages 36-37). The model  
16 calibration results show that when the MPSC Staff ran its RealTime model  
17 using the same inputs as used by the Company, the RealTime model  
18 determined almost identical net fuel costs to those determined by the  
19 PROSYM model that I ran.

---

<sup>1</sup> Net fuel costs also include capacity sales and Midwest Independent Transmission System Operator, Inc. (MISO) Revenue Sufficiency Guarantee (RSG) – Make Whole Payments, which are addressed in the rebuttal testimony of AmerenUE witness Shawn E. Schukar. These items are not determined as a result of production cost modeling, but rather, are based upon Mr. Schukar’s analyses. I would also note that “net fuel costs” differ from the “net base fuel costs” calculated by AmerenUE witness Gary S. Weiss for setting the base around which changes would be tracked in the Company’s proposed fuel adjustment clause (FAC), because of the need to include items that cannot be determined using production cost modeling. The items were outlined in footnote 1 of my supplemental direct testimony.

1           **Q.     Does this mean that there are no differences between AmerenUE’s and**  
2           **the MPSC Staff’s net fuel costs?**

3           A.     No, as I noted, the nearly identical results between the two models are  
4           produced only if the Company and the MPSC Staff agree on all modeling  
5           inputs. In fact, there is one input-related issue about which there is conceptual  
6           agreement, but which cannot be finalized until the Company and the MPSC  
7           Staff re-run their models in order to finalize the true-up, and there is another  
8           input-related issue about which the Company and the MPSC Staff are not in  
9           agreement – power market prices, which affect the normalized level of power  
10          purchases and off-system sales. In addition, there are disagreements about  
11          certain costs and revenues for items that are not easily handled in a production  
12          cost model, such as PROSYM or RealTime, including: (1) margins from  
13          MISO Revenue Sufficiency Guarantee – Make Whole Payments (addressed in  
14          Mr. Schukar’s rebuttal testimony) and (2) costs associated with under-  
15          forecasting loads in the MISO Day 2 Market (addressed below).

16          **Q.     Why is there a true-up for load growth and fuel costs?**

17          A.     A true-up to September 30, 2008 was ordered by the Commission for this case  
18          based upon the parties’ agreement. The true-up for customer growth is done  
19          to adjust sales to reflect known and measurable changes resulting from a  
20          change in the number of customers. The true-up for fuel costs is done to  
21          adjust fuel prices to reflect current fuel costs as of the true-up date,  
22          September 30, 2008.

1           **Q.    What issues need to be resolved with regard to power market prices used**  
2           **for spot purchase power prices and off-system sales, after the true-up**  
3           **data for load growth and fuel costs is known?**

4           A.    Either the parties will have to agree on power market prices, or the  
5           Commission will have to resolve any disagreement. Table TDF-R1 lists the  
6           off-system sales (OSS) statistics from the updates provided in my rebuttal  
7           testimony and the workpapers provided in support of the MPSC Staff model  
8           run reflecting the September 30, 2008 true-up period (completed in  
9           connection with the Staff’s direct case filing).

Table TDF-R1 – Total Off-System Sales Statistics (Hedged and Unhedged )			
	OSS Volume MWh	OSS Revenues (energy only) \$	OSS Price \$/MWh
AmerenUE rebuttal	10,162,000	\$451,556,200	\$44.43/MWh
MPSC Staff –True-Up Run (T_BL_Stat_1653.pdf)	9,886,734	\$445,066,000	\$45.02/MWh

10

11                           Using the average volume of off-system sales from Table TDF-R1,  
12           approximately 10 million MWh and a market price difference of  
13           approximately \$.60/MWh, results in a \$6 million difference in net fuel costs  
14           due to the use of different power market prices in the Company’s versus the  
15           Staff’s models.

16           **Q.    Why do production cost models have difficulty calculating margins from**  
17           **MISO Revenue Sufficiency Guarantee – Make Whole Payments and costs**

1 **associated with under-forecasting AmerenUE loads in the MISO Day 2**  
2 **market?**

3 A. The PROSYM and RealTime production cost models make good economic  
4 decisions assuming perfect knowledge of various items such as loads, fuel  
5 costs, and market prices. Thus, these models are not designed to address  
6 issues that relate to uneconomic operation of generating plants and  
7 uncertainties such as load forecasting uncertainty.

8 The MISO RSG – Make Whole payments are the result of MISO  
9 operational decisions that force units to operate for system reliability rather  
10 than for economic operations, and thus are not calculated in the production  
11 cost models. Mr. Schukar is addressing the impact of MISO RSG - Make  
12 Whole payments on off-system sales margins (RSG - Make Whole Payments  
13 less operating costs). Mr. Schukar has estimated the margins from MISO  
14 RSG - Make Whole Payments to be \$4.7 million per year.

15 The MISO Day 2 market creates extra costs from under-forecasting the  
16 AmerenUE load. The MISO Day 2 market has a Day Ahead (DA) market  
17 which is based on load forecasts made the day prior to the actual operating  
18 day, and a Real Time (RT) market which is based on loads for the actual  
19 operating day. When the DA load forecast is lower than the RT load, the  
20 additional load is served by energy purchased from the MISO RT market.  
21 The PROSYM and RealTime production cost models use only a single load  
22 forecast which is equivalent to the RT load forecast. This means that under-  
23 forecasting loads, which does occur, is simply not reflected in production cost

1 models and any costs associated from under-forecasting loads are missed.  
2 This understates the Company's production costs.

3 **Q. Please explain the impact of under-forecasting loads.**

4 A. The impact of the load forecasting deviations is calculated by multiplying the  
5 load forecast deviations times the difference between the Day Ahead  
6 Locational Market Price (DA-LMP) and the Real Time Locational Market  
7 Price (RT-LMP). For example, on January 2, 2008, for the hour ending 1  
8 a.m., the Day Ahead forecast was 5183 MW and the modeled Real Time load  
9 was 5431 MW. Thus, the load was under-forecasted by 248 MW. Also the  
10 DA-LMP was \$26.63/MWh and the RT-LMP was \$30.64/MWh, resulting in  
11 an additional cost of \$4.01/MWh for meeting the extra load. The cost impact  
12 of this load forecast deviation is \$994 (248 MW x \$4.01/MWh = \$994). It  
13 should be noted that in this example, the RT-LMP was higher than the  
14 DA-LMP; however, this is not always the case. If the RT-LMP is lower than  
15 the DA-LMP, then there is a benefit from under-forecasting. It is appropriate  
16 to include the cost associated with under-forecasting loads in AmerenUE's  
17 cost of service because AmerenUE must buy power from the MISO market in  
18 order to supply its load. Table TDF-R2 shows the impact of under-forecasting  
19 loads over the past 33 months. The average annual dollar impact over this  
20 period was approximately \$4.5 million, which should be added to the cost to  
21 serve AmerenUE's load.

22

1

Table TDF-R2 – Impact of Under-Forecasting Loads			
		MWh of under-forecasting	\$ Impact
2006		803,497	\$ 2,974,906
2007		646,116	\$ 4,047,425
2008 (Jan- Sept)		538,045	\$ 4,811,746
Annual Average		722,335	\$ 4,479,331

2

3 **Q. Does over-forecasting of loads occur?**

4 A. Yes, over-forecasting also occurs. Table TDF-R3 lists loads, MWh of over-  
5 forecasting and MWh of under-forecasting for the time period January 2006  
6 through September 2008.

Table TDF-R3 – Load Forecasting Deviations			
	Total Load	MWh of over-forecasting	MWh of under-forecasting
2006	42,380,669	755,649	803,497
2007	42,542,296	740,626	646,116
2008 (Jan- Sept)	32,034,095	597,598	538,045
Annual Average	42,545,031	764,357	722,335

7

8 **Q. Is there a cost associated with over-forecasting loads?**

9 A. I have assumed that no adjustment for over-forecasting is necessary. Over-  
10 forecasting loads means that the actual or RT load is lower than projected and  
11 that additional energy from AmerenUE generators is available to make off-  
12 system sales. As mentioned earlier, the production cost models use loads  
13 equivalent to the RT loads, thus the models are already making all the off-

1 system sales that are economical. As a consequence, I have assumed there is  
2 no cost impact associated with over-forecasting loads.

3 **Q. How is the cost of under-forecasting loads handled in the production cost**  
4 **models?**

5 **A.** The PROSYM model used “must take” purchased power resources to  
6 represent the purchases from MISO when load under-forecasting occurs. The  
7 price of the purchased power resource is set to a value that is higher than the  
8 market price used by the model. By using a purchase price higher than the  
9 market price, the production cost model calculates a loss from this purchased  
10 power resource. The purchased power resource size and price is set up to  
11 equal the projected cost of under-forecasting loads. In discussions with  
12 MPSC Staff witness John Cassidy, I confirmed that the RealTime model did  
13 not factor in any impact associated with under-forecasting loads.

14 **Q. What cost for under-forecasting loads was used in the PROSYM model**  
15 **run to calculate net fuel costs?**

16 **A.** The current PROSYM model run used for this rebuttal testimony includes  
17 costs related to under-forecasting loads of \$1.3 million, the same value that  
18 was used in my direct and supplemental direct testimonies.

19 **Q. Shouldn't the cost of under-forecasting be trued up in a manner similar**  
20 **to other true-up items?**

21 **A.** Yes. The cost of under-forecasting loads should be trued up in a manner  
22 similar to other true-up items. This should be done using an average annual  
23 cost of under-forecasting loads for the 24-month period ending September 30,

1 2008, which as shown in Table TDF-R2 above is \$4.7 million. This amount is  
2 \$3.4 million higher than the value in my current calculation of net fuel costs  
3 and it could vary slightly when actual true-up data is used. As noted, Staff's  
4 model fails to account for the cost of under-forecasting entirely.

## 5 **II. Net Fuel Cost Update**

6 **Q. Why are you updating the normalized annual net fuel costs?**

7 A. I am updating the normalized annual net fuel costs because I have obtained  
8 updated data for normalized annual loads; coal, gas, oil, and nuclear costs; and  
9 updated power market prices used for determining short-term power  
10 purchases and short-term off-system sales.

11 Mr. Weiss provided me with updated normalized annual loads. The  
12 update reflects a new estimate of customer growth during the period April 1,  
13 2008 and September 30, 2008. The updated annualized normal load is  
14 41,196,233 MWh, down 148,337 MWh from the amount used in my  
15 supplemental direct testimony. Note that the annualized normalized load may  
16 change slightly when the September 30 true-up run is completed.

17 I have also updated the coal costs to match the coal costs used by the  
18 MPSC Staff in connection with the RealTime model run included in Staff's  
19 August 28, 2008 Cost of Service filing. The MPSC Staff costs are lower than  
20 the coal costs used in my supplemental direct testimony due to updates to the  
21 components used to calculate delivered coal costs to the plants and the  
22 removal of the SO<sub>2</sub> price adjustment from the coal costs. The Company and  
23 Staff have agreed to move the SO<sub>2</sub> price adjustment component of the coal

1 costs from net fuel costs to the SO<sub>2</sub> tracker. The updated average coal cost is  
2 \$1.461/MMBtu, down \$0.21/MMBtu from the amount used in my  
3 supplemental direct testimony.

4 The variable gas and oil costs have been updated to reflect the actual  
5 gas and oil costs for the 24-month period ending September 2008, which is the  
6 same time period used to develop the market prices for short-term power  
7 purchases and off-system sales. The updated average gas cost is  
8 \$7.459/MMBtu, up \$0.720/MMBtu from the amount used in my supplemental  
9 direct testimony. The updated average oil cost is \$16.852/MMBtu, up  
10 \$3.260/MMBtu from the amount used in my supplemental direct testimony.

11 The nuclear fuel costs were updated to reflect the most current nuclear  
12 fuel costs associated with the Fall 2008 refueling outage. The updated  
13 average nuclear fuel cost is \$0.632/MMBtu, down \$0.25/MMBtu from the  
14 amount used in my supplemental direct testimony.

15 The market prices used for short-term power purchases and unhedged  
16 off-system sales were updated by Mr. Schukar, as described in his rebuttal  
17 testimony. The update was based on actual market prices for the 24-month  
18 period ending September 2008. The updated annual market price for short-  
19 term power purchases and sales is \$43.57/MWh, up \$3.10/MWh from the  
20 \$40.47/MWh utilized in the production cost model run for pricing short-term  
21 power purchases and unhedged off-system sales sponsored by my  
22 supplemental direct testimony.

1           **Q.     Did the changes just described change the value attributed to Taum Sauk**  
2                 **plant operations?**

3           A.     Yes, the Taum Sauk benefit calculation I had provided in my supplemental  
4                 direct testimony has been updated to reflect the changes in the items  
5                 previously mentioned. The updated annual net fuel cost benefit from Taum  
6                 Sauk plant operations is \$25.8 million, up \$2.1 million from the \$23.7 million  
7                 benefit discussed in my supplemental direct testimony. The \$25.8 million is  
8                 comprised of energy benefits of \$20.9 million determined by the PROSYM  
9                 model, and capacity sales revenues of \$4.9 million. The energy value  
10                increased by \$2.1 million due to changes in loads, fuel costs, and market  
11                prices used for spot purchases and the unhedged off system sales; however,  
12                the capacity sales portion of this benefit has not changed from my  
13                supplemental direct testimony.

14                                 **III.    Conclusion**

15           **Q.     What are AmerenUE's updated net fuel costs?**

16           A.     The updated normalized annual net fuel costs are \$288 million, down \$23  
17                 million from the net fuel cost of \$311 million which was discussed in my  
18                 supplemental direct testimony. The updated normalized net fuel costs are  
19                 comprised of fuel costs of \$684 million and purchased power costs of \$56  
20                 million (resulting in gross fuel costs of \$740 million), and are then reduced by  
21                 energy-related off-system sales revenues from my PROSYM run of \$452  
22                 million, which results in the updated \$288 million net fuel cost figure. As  
23                 noted, this figure will be adjusted by Mr. Weiss when the final true-up in the

1 case is done to arrive at the actual total fuel and purchase power expense, net  
2 of off-system sales, that comprise the net base fuel cost (NBFC) for the  
3 Company.

4 **Q. Does this conclude your rebuttal testimony?**

5 A. Yes, it does.

**BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI**
