Case No. ER-2008-0318

STATE OF MISSOURI)
COUNTY OF ST. LOUIS) SS

Affidavit of Michael Gorman

Michael Gorman, being first duly sworn, on his oath states:

1. My name is Michael Gorman. I am a consultant with Brubaker & Associates, Inc., having its principal place of business at 16690 Swingley Ridge Road, Suite 140, Chesterfield, MO 63017. We have been retained by the Missouri Industrial Energy Consumers in this proceeding on their behalf.
2. Attached hereto and made a part hereof for all purposes is my rebuttal testimony and schedules which were prepared in written form for introduction into evidence in Missouri Public Service Commission Case No. ER-2008-0318.
3. I hereby swear and affirm that the testimony and schedules are true and correct and that they show the matters and things they purport to show.

Michael Gorman

Subscribed and sworn to before me this 13th day of October, 2008.

Case No. ER-2008-0318

Rebuttal Testimony of Michael Gorman

1 **Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A Michael Gorman. My business address is 16690 Swingley Ridge Road, Suite 140,
3 Chesterfield, MO 63017.

4 **Q ARE YOU THE SAME MICHAEL GORMAN WHO FILED TESTIMONY**
5 **PREVIOUSLY IN THIS PROCEEDING?**

6 A Yes.

7 **Q WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY IN THIS**
8 **PROCEEDING?**

9 A I will respond to AmerenUE witness Dr. Roger Morin's proposed return on equity.

Michael Gorman
Page 1

1 **Response to AmerenUE Witness Dr. Roger Morin**

2 **Q WHAT RATE OF RETURN ON COMMON EQUITY IS AMERENUE REQUESTING**
3 **IN THIS PROCEEDING?**

4 A AmerenUE is requesting a return on common equity of 10.9%, if AmerenUE's fuel
5 adjustment clause (FAC) proposed in this proceeding is approved. However,
6 Dr. Morin proposes an 11.15% return on equity if the FAC is not approved.

7 **Q PLEASE DESCRIBE HOW DR. MORIN DEVELOPED HIS RETURN ON EQUITY**
8 **RANGE FOR AMERENUE.**

9 A Dr. Morin used a capital asset pricing model, an empirical capital asset pricing model,
10 two risk premium studies, and several discounted cash flow studies to support his
11 return on equity estimate for AmerenUE. Dr. Morin employed these models to two
12 proxy groups including: (1) Standard & Poor's Integrated Electric Utility Index; and
13 (2) the Moody's Electric Utility Index.

14 Dr. Morin's estimated return on equity for AmerenUE is shown below in
15 Table 1 under column 1. Under column 2, I show adjustments to Dr. Morin's
16 estimated return for AmerenUE. These adjustments are described in more detail
17 below.

TABLE 1

Summary of Dr. Morin's ROE Estimates

<u>Description</u>	<u>Result</u> (1)	<u>Adjusted Result</u> (2)
Traditional CAPM	11.2%	10.29%
ECAPM	11.5%	Reject
Average CAPM	11.4%	10.29%
Historical Risk Premium Electric	10.5%	10.2%
Allowed Risk Premium	10.1%	10.1%
Average Risk Premium	10.3%	10.2%
DCF Vertically Integrated Utilities (<i>Value Line</i> Growth)	10.4%	9.5%
DCF Vertically Integrated Utilities (Zacks Growth)	11.6%	9.7%
DCF Moody's Electric Utilities (<i>Value Line</i> Growth)	11.1%	9.4%
DCF Moody's Electric Utilities (Zacks Growth)	11.0%	9.5%
Average DCF	11.0%	9.5%
Average ROE	10.9%	10.0%

Source: Morin Direct Testimony at 65.

1 As described in detail below, Dr. Morin's ROE estimates should be adjusted
2 as shown in column 2 of the table above. Based on these adjustments, Dr. Morin's
3 return on equity estimates support a return on equity for AmerenUE in the range of
4 9.5% to 10.3%, with a midpoint of 9.9%. Therefore, Dr. Morin's analyses, with
5 reasonable adjustments, support my recommended return on equity of 10.2%.

6 **Q PLEASE DESCRIBE DR. MORIN'S TRADITIONAL CAPM ANALYSIS.**

7 **A** Dr. Morin used a risk-free rate of 4.5%, a market risk premium of 7.4%, and a beta of
8 0.87. With this data, Dr. Morin derived a CAPM estimate of 10.9%. He then added a
9 30 basis point return premium for flotation costs. This flotation adjustment increased
10 his CAPM return estimate to 11.2%. (Morin Direct Testimony at 40).

Michael Gorman
Page 3

1 **Q WHAT ISSUES DO YOU TAKE WITH DR. MORIN'S CAPM ANALYSIS?**

2 A For the reasons set out later in this testimony, I reject Dr. Morin's flotation cost
3 because it is not based on AmerenUE-specific costs. Dr. Morin's CAPM analysis
4 return estimate of 10.9% (excluding flotation costs) is overstated and unreasonable,
5 due to his use of an unreasonably high market risk premium of 7.4%. Further, it is
6 worthy of note that utility betas have materially decreased since Dr. Morin filed his
7 testimony. These updated betas would lower Dr. Morin's CAPM return estimate.

8 **Q HOW DID DR. MORIN DERIVE HIS MARKET RISK PREMIUM OF 7.4%?**

9 A Dr. Morin relied on two studies. First, he used the market risk premium of 7.1%
10 derived from the data provided by Morningstar. Second, Dr. Morin developed a
11 prospective market risk premium of 7.7% using the data provided by *Value Line*. The
12 7.4% market risk premium is the average of these two estimates.

13 **Q WHAT ISSUES DO YOU HAVE WITH DR. MORIN'S MORNINGSTAR MARKET**
14 **RISK PREMIUM ESTIMATE?**

15 A Dr. Morin's market risk premium estimate is a high-end estimate and does not reflect
16 a complete investigation of the market risk premium estimates made by Morningstar.
17 A complete consideration of Morningstar's estimate indicates that a market risk
18 premium falls in the range of 6.2% to 7.1%.

19 Morningstar does estimate a market risk premium of 7.1% based on the
20 difference between the total market return on common stocks (S&P 500) less the
21 income return on Treasury bond investments. However, Morningstar makes various
22 estimates of the market risk premium with this same methodology. For example,
23 Morningstar found that if the New York Stock Exchange (NYSE) was used as the

1 market index rather than the S&P 500, then the market risk premium would be 6.8%
2 and not 7.1%. Further, if only the two deciles of the largest companies included in the
3 NYSE were used as the market index (which would be comparable to the S&P 500),
4 then the market risk premium would be 6.35%.¹

5 Morningstar also found that the 7.1% market risk premium based on the S&P
6 500 was impacted by an abnormal expansion of price-to-earnings (P/E) ratios relative
7 to earnings and dividend growth during the period 1980 through 2001. Morningstar
8 believes this abnormal P/E expansion is not sustainable. Therefore, Morningstar
9 proposed an adjustment to this market risk premium estimate to normalize the growth
10 in the P/E ratio to be more in line with the growth in dividends and earnings. Based
11 on this alternative methodology, Morningstar published a long-horizon supply-side
12 market risk premium of 6.2%.²

13 Thus, based on all of Morningstar's estimates, the market risk premium falls in
14 the range of 6.2% to 7.1%. The midpoint of Morningstar's market risk premium
15 estimate is 6.65%.

16 **Q DO YOU TAKE ISSUE WITH THE PROSPECTIVE MARKET RISK PREMIUM OF**
17 **7.7% ESTIMATED BY DR. MORIN?**

18 **A** Yes. I conclude this market risk premium is flawed and unreliable. Therefore, it
19 should be rejected. Dr. Morin's prospective market risk premium estimate is based
20 on a market DCF return of 12.2% less the risk-free rate, 4.5%, which produces a
21 market risk premium of 7.7%. This market risk premium is flawed and unreliable

¹ Morningstar observes that the S&P 500 and the NYSE Decile 1-2 are both large capitalization benchmarks. *Ibbotson SBBI 2008 Valuation Yearbook* (Morningstar, Inc.) at 72 and 74.

² *Id.* at 92-98.

1 because the growth rate used in his market DCF return estimate is an unreasonable
2 estimate of long-term sustainable growth, as required by this DCF model.

3 Dr. Morin's market DCF return estimate is 12.2%. This DCF return is based
4 on a growth rate of 9.3%, and a dividend yield of 2.4%. Using the annual version of
5 the DCF model, these parameters produce a DCF return estimate of 11.92%.³ To
6 reflect quarterly compounding, this market DCF return would increase to 11.95%.⁴
7 Hence, Dr. Morin's parameters support a DCF return of only 11.95%, not 12.2%.
8 Hence, since he overstated the DCF return on the market using his own parameters,
9 his market risk premium of 7.7% should be decreased to at least 7.45%. However,
10 there are other reasons to reject this market risk premium estimate. Specifically, this
11 DCF return is based on a growth rate of 9.3%. This growth rate of 9.3% is not
12 sustainable in the long term, as required by his DCF model. Therefore, his market
13 DCF return on the market is flawed and not reliable.

14 Just like utility stocks, companies operating in the general marketplace must
15 compete for customers in the economies in which they provide their goods and
16 services. It is simply not rational nor reasonable to expect that the growth rates of
17 these companies can significantly exceed the growth in the economy in which they
18 operate over an indefinite period of time.

19 The constant growth version of the DCF model applied to the market is the
20 same as that applied to utility stocks. The growth rate must be a reasonable estimate
21 of long-term sustainable growth; otherwise, it will overstate a fair DCF return estimate.

³ $(2.4\% * 1.093) + 9.3\%$

⁴ $[(2.4\%/4 * (1.093)^{1/4}) + (1.093)^{1/4}]^4 - 1$

1 Q IS THERE ANY EVIDENCE THAT LONG-TERM GROWTH IN EARNINGS AND
2 DIVIDENDS OF THE S&P 500 WILL TRACK THE GROWTH OF THE U.S. GDP?

3 A Yes. Morningstar found that the dividends and earnings of the S&P 500 generally
4 grew in tandem with the nominal GDP over long periods of time.⁵ Further, as noted in
5 my direct testimony, academic research supports the rational conclusion that over
6 long-term sustainable periods, the earnings and dividend growth of mature
7 companies, which are a reasonable proxy for the overall market, will track that of the
8 nominal GDP growth. As such, actual historical performance and rational
9 expectations based on sound academic principles, support the conclusion that
10 long-term sustainable growth rates for the market index will not exceed that of the
11 growth of the U.S. GDP.

12 Q HOW DOES DR. MORIN'S MARKET DCF GROWTH RATE COMPARE TO THE
13 PROJECTED GROWTH OF THE U.S. GDP?

14 A The growth rate Dr. Morin used in his market DCF return estimate of 9.3%
15 significantly exceeds the consensus economists' projections of GDP growth over the
16 next five and ten years. Specifically, *The Blue Chip Economic Indicators* publishes
17 the consensus of economists' projected long-term growth to be approximately 5%.
18 Dr. Morin's market DCF return estimate of 9.3% is nearly twice as high as that of the
19 projected long-term GDP growth. Therefore, Dr. Morin's market-based DCF analysis
20 produces a flawed market return estimate, which significantly inflates his market risk
21 premium estimate. Therefore, Dr. Morin's prospective market risk premium is based
22 on a flawed analysis, is unreliable, and should be rejected.

⁵ Ibbotson SBBI 2008 Valuation Yearbook (Morningstar, Inc.) at 92.

1 **Q WHAT DO YOU CONCLUDE BASED ON YOUR ASSESSMENT OF DR. MORIN'S**
2 **MARKET RISK PREMIUM STUDIES?**

3 A I believe Dr. Morin's use of the market risk premium of 7.4% exceeds the high end of
4 reasonable market risk premium studies. Using Morningstar data, a reasonable
5 market risk premium is in the range of 6.2% to 7.1%. The midpoint of that range is
6 6.65%. I reject Dr. Morin's prospective market risk premium for the reasons
7 described above.

8 **Q HAVE THE BETAS OF DR. MORIN'S PROXY GROUP CHANGED SINCE HE**
9 **FILED HIS TESTIMONY?**

10 A Yes. They have declined, as shown on my Schedule MPG-R-1. The S&P Integrated
11 Electric Utility Index beta has declined from 0.87 to 0.81. The beta for the Moody's
12 Electric Utility Index group has declined from 0.86 to 0.80. (Morin Direct at 35).

13 **Q HOW WOULD DR. MORIN'S CAPM ESTIMATE BE IMPACTED IF A MORE**
14 **REASONABLE MARKET RISK PREMIUM IS USED?**

15 A Using a market risk premium of 6.65%, which is the midpoint of the range of market
16 risk premiums estimated by Morningstar, and excluding a flotation cost adjustment,
17 Dr. Morin's CAPM return estimate would decline to 10.29%.⁶

18 **Q PLEASE DESCRIBE DR. MORIN'S EMPIRICAL CAPM (ECAPM) ANALYSIS.**

19 A The ECAPM analysis adds two weighted risk premiums to a risk-free rate: a 75%
20 weighted risk premium based on a 0.87 utility beta, and a 25% weighted risk premium
21 based on a beta equal to the overall market beta of 1.0. The theory of the ECAPM is

⁶ 4.5% + (.87 x 6.65%).

1 that a beta of less than 1.0 will increase toward the market beta of 1.0 over time,
2 which is necessary because the risk of securities will be increasing over time.

3 **Q WHAT ISSUES DO YOU TAKE WITH DR. MORIN'S ECAPM ANALYSIS?**

4 A The ECAPM analysis should be rejected for several reasons. First, the practical
5 result of Dr. Morin's ECAPM is that the CAPM return is based on a beta estimate of
6 0.90,⁷ instead of his actual *Value Line* utility beta of 0.87. Indeed, the ECAPM
7 analysis significantly overstates a utility company-specific risk premium for use in a
8 risk premium analysis.

9 Second, the ECAPM produces the same adjustment result on a CAPM return
10 estimate as does the use of an adjusted *Value Line* beta. Theoretical constructs of
11 the ECAPM are based on a raw beta or unadjusted betas. Using a raw beta, the
12 ECAPM will increase the CAPM return estimate when the raw betas are less than 1.0,
13 and decrease the CAPM return estimate when the raw betas are greater than 1.0.

14 *Value Line's* adjusted beta creates the same impact on a CAPM return
15 estimate as the ECAPM. Specifically, *Value Line's* beta adjustment when used in a
16 traditional CAPM return estimate, will increase a CAPM return estimate when the beta
17 is less than 1.0, and decrease the CAPM return estimate when the beta is greater
18 than 1.0. Therefore, an ECAPM with a raw beta produces the same impact on the
19 CAPM return estimate as does a traditional CAPM using an adjusted beta estimate.
20 Importantly, I am not aware of any research, that was subjected to peer review, that
21 supports Dr. Morin's proposed use of an adjusted beta in an ECAPM study.
22 Therefore, Dr. Morin's proposal to use an adjusted beta in an ECAPM is not based on

⁷ Weighted at 75% utility proxy beta, plus the market beta of 1.0 weighted at 25%.

1 sound academic principles, is not supported by the academic community, and should
2 be rejected.

3 Further, using an adjusted beta in an ECAPM analysis, as Dr. Morin proposes,
4 double-counts the increase in the CAPM return estimates for betas less than 1.0, and
5 correspondingly would decrease the CAPM return estimates for companies that have
6 betas greater than 1.0. Since utility companies have betas less than 1.0, Dr. Morin's
7 application of an ECAPM with adjusted beta estimates, overstates a CAPM return
8 estimate for a utility company.

9 For all these reasons, Dr. Morin's ECAPM analysis should be rejected.

10 **Historical Risk Premium**

11 **Q PLEASE DESCRIBE DR. MORIN'S HISTORICAL RISK PREMIUM.**

12 A Dr. Morin estimates the actual achieved return on electric utility stocks relative to that
13 of long-term Treasury bond securities over the period 1931 through end of year 2006.
14 This produced an achieved return on electric utility stocks above the achieved return
15 on Treasury bonds of 5.7%.⁸

16 Dr. Morin then adds the estimated electric equity risk premium of 5.7% to his
17 projected yield on long-term Treasury bonds of 4.5%, to arrive at a risk premium
18 estimated return of 10.2%. Finally, he increased these results by 30 basis points to
19 include a flotation cost adder that produced a risk premium return of 10.5%.⁹

20 **Q WHAT ISSUE DO YOU TAKE WITH DR. MORIN'S RISK PREMIUM?**

21 A Dr. Morin's achieved return on utility stocks, compared to Treasury securities, should
22 be given little weight in this proceeding for several reasons. First, Dr. Morin's analysis

⁸ Schedule RAM-E3.

⁹ Morin Direct Testimony at 44.

1 has not been updated for the last year, and it therefore skews the results of this
2 historical achieved return study. Dr. Morin's study was concluded in 2006. However,
3 excluding data from 2007 likely has an impact on his study. Failing to update this
4 study diminishes the unbiased nature of the analysis and provides Dr. Morin a means
5 of misrepresenting this historical achieved return estimate.

6 Second, the achieved return on Treasury securities versus utility securities
7 has been impacted significantly by the dramatic decrease in interest rates over the
8 last 20 years. Hence, the achieved return on these securities is not as much an
9 assessment of consistent or varying risk differentials and required return, as it is an
10 assessment of the impact that declining interest rates and reduced inflation
11 expectations have on stock versus bond investments.

12 Third, the estimated risk premium from this methodology is sensitive to the
13 annual time period selected. Dr. Morin has used December to December as an
14 annual time period. Had he used different months, for example July through July, his
15 results may have been very different. More thorough analyses, such as that
16 performed by Morningstar, consider annual holding periods that can take place
17 throughout the year. That is, it considers each holding period for each month in the
18 year. Dr. Morin's estimated equity risk premium may be higher than average for
19 12-month holding periods simply by using end-of-year data. Hence, his analysis of
20 an annual holding period's achieved return is incomplete because it does not reflect
21 the total breadth of possible 12-month holding periods for investments in utility and
22 Treasury securities.

1 Q CAN DR. MORIN'S RISK PREMIUM ANALYSES BE USED TO PRODUCE A
2 MORE REASONABLE RETURN ESTIMATE?

3 A Setting aside the issues I have with Dr. Morin's historical 5.7% risk premium, simply
4 excluding his unreasonable 30 basis point flotation cost adjustment, will reduce his
5 risk premium estimate from 10.5% to 10.2%. For the reasons set forth above, I reject
6 the inclusion of a flotation cost adjustment in this case because Dr. Morin has failed
7 to identify AmerenUE-specific costs that are appropriate for including in its rate of
8 return in this proceeding.

9 **DCF Analyses**

10 Q PLEASE DESCRIBE DR. MORIN'S DCF ANALYSES.

11 A Dr. Morin performed a constant growth DCF analysis on: (1) Standard & Poor's
12 Integrated Electric Utility Index; and (2) the Moody's Electric Utility Index. Dr. Morin
13 constructed two DCF analyses for each of the utility groups using a consensus
14 analysts' growth rate projection from Zacks for one DCF analysis and a second DCF
15 analysis using *Value Line's* projected growth rate.

16 As shown on Schedule RAM-E5 through Schedule RAM-E8, he relied on
17 growth rate estimates in the range of 5.8% to 7.5% from both *Value Line* and Zacks
18 to produce a DCF cost of equity in the range of 10.2% to 11.9%. He then added a
19 20-30 basis point flotation cost adjustment to arrive at adjusted returns on equity in
20 the range of 10.4% to 12.1%, with a midpoint of 11.25%.

1 **Q PLEASE DESCRIBE THE ISSUES YOU TAKE WITH DR. MORIN'S DCF**
2 **ANALYSES.**

3 A I have two major issues with Dr. Morin's DCF model. First, Dr. Morin uses *Value Line*
4 growth rate estimates that are provided by a single analyst. Second, he uses growth
5 rate estimates that are not sustainable in the long run.

6 **Q WHY IS IT UNREASONABLE TO RELY ON GROWTH RATE ESTIMATES**
7 **PROVIDED BY VALUE LINE?**

8 A *Value Line* provides projected 3-5 year growth rates estimated by a single security
9 analyst. As discussed above, using a source that contains consensus analysts'
10 growth rate projections supplied by many analysts better reflects the market's growth
11 expectations of the underlying stock. Hence, Dr. Morin's DCF studies, based on his
12 Zacks growth rate projections, are superior to those produced from his *Value Line*
13 growth rate projections.

14 Therefore, I recommend that the Commission give primary weight to
15 Dr. Morin's DCF return estimates based on his Zacks growth rate models, excluding
16 his flotation cost adjustment.

17 **Q WHY ARE THE GROWTH RATE ESTIMATES USED IN DR. MORIN'S DCF STUDY**
18 **NOT REASONABLE?**

19 A Dr. Morin average growth rates from *Value Line* and Zacks fall in the range of 5.8% to
20 7.5%. These growth rate estimates exceed the projected GDP growth rate of 5.0%
21 and 4.8% for the next 5 and 10 years, respectively. As explained in detail above, the
22 GDP growth rate can be used as a proxy for long-term sustainable growth rate
23 because it represents the maximum growth rate of the U.S. economy. The growth

1 rate estimates used in Dr. Morin's DCF study exceed the projected GDP growth rate
2 of 4.9% (the average of 5.0% and 4.8%) by 90-260 basis points, and inflate the DCF
3 return on equity results for AmerenUE.

4 **Q CAN DR. MORIN'S DCF MODEL BE MODIFIED TO REFLECT MORE**
5 **REASONABLE GROWTH RATE ESTIMATES?**

6 A Yes. In order to reflect the current industry environment of abnormal capital
7 investments that increase utility rate base and impacts analysts' growth rate
8 projections, Dr. Morin's constant growth DCF model can be modified into a two-stage
9 DCF model that will reflect a more reasonable growth rate in the second stage.

10 **Q DID DR. MORIN RECOGNIZE THE PROBLEMS WITH THE CONSTANT DCF**
11 **MODEL IN THE CURRENT UTILITY INDUSTRY ENVIRONMENT?**

12 A Yes. At page 59 of his direct testimony, Dr. Morin emphasized the fact that the
13 constant DCF is not applicable in the current dynamic utility industry. Dr. Morin also
14 agrees that using a non-constant DCF model is more reasonable.

15 **Q DID DR. MORIN ATTEMPT TO DEVELOP A TWO-STAGE DCF MODEL?**

16 A Yes. Dr. Morin discussed the use of his average growth rate of 6.2% for the first
17 stage and his estimate for the projected long-term GDP growth of 6.1% for the
18 second stage as discussed at page 60 of his direct testimony.

19 Applying the Federal Energy Regulatory Commission's methodology adopted
20 by Dr. Morin will require giving 2/3 weight to the average analysts' growth rate of
21 6.2% and 1/3 weight to his projected GDP growth of 6.1%. Considering the fact that
22 these growth rates are almost identical the return on equity produced by this

1 methodology is almost identical to the return on equity estimated through the
2 traditional DCF model.

3 **Q DO YOU HAVE ANY CONCERNS WITH DR. MORIN'S GDP GROWTH RATE**
4 **ESTIMATE OF 6.1%?**

5 A Yes. Dr. Morin's GDP growth projection represents his own judgment, not a
6 consensus estimate provided by independent research such as the *Blue Chip*
7 *Financial Forecast*. Using a consensus estimate is more accurate because it
8 provides an unbiased opinion for the future state of the U.S. economy. The
9 consensus is more objective than the estimate provided by a single analyst such as
10 Dr. Morin or myself.

11 **Q HOW WILL DR. MORIN'S DCF RESULT CHANGE IF WE APPLY THE**
12 **TWO-STAGE DCF MODEL WITH A CONSENSUS GDP GROWTH PROJECTION?**

13 A Setting aside the issues I have with Dr. Morin's use of the *Value Line* growth
14 estimates, I have applied the two-stage DCF model to his return estimates developed
15 on Schedule RAM-5 through Schedule RAM-8. Excluding Dr. Morin's flotation cost
16 adjustment, the average DCF return will be reduced from 11.0% to 9.5% as shown on
17 Schedule MPG-R-2.

18 **Flotation Cost Adjustment**

19 **Q IS DR. MORIN'S PROPOSED FLOTATION COST ADJUSTMENT REASONABLE?**

20 A No. Flotation cost adjustments are a legitimate cost of issuing stock to the public.
21 Actual book costs, however, should be used for this adjustment so the Commission
22 Staff, and other interested intervenors, can audit the Company's actual common

Michael Gorman
Page 15

1 stock flotation expenses for reasonableness and amount. Any adjustment to
2 AmerenUE's cost of service for flotation cost expenses should be based only on
3 known and measurable common stock flotation expenses.

4 In significant contrast, Dr. Morin's proposed flotation cost adjustment is not
5 based on AmerenUE's known, measurable, prudent, and reasonable common stock
6 flotation costs. Rather, it is based on a general study of market flotation costs that
7 may or may not have any relationship to AmerenUE's actual cost of issuing stock to
8 the public. Indeed, Dr. Morin acknowledges that AmerenUE is not a publicly traded
9 company, and therefore it is unclear what, if any, AmerenUE's common stock flotation
10 cost expenses might be. Further, while AmerenUE receives its incremental equity
11 capital from its parent company, it is not clear whether that equity capital is being
12 funded by public common stock issuances, debt issuances, or internally generated
13 funds. Hence, it simply is not known and measurable what, if any, common stock
14 flotation costs should be properly allocated to AmerenUE and should be reflected in
15 its cost of service in this proceeding. For these reasons, Dr. Morin's proposed
16 flotation cost adjustment is not based on known and measurable expenses and
17 should be rejected.

18 **Q DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?**

19 **A** Yes, it does.

\\Hury\Shares\PLDocs\SDW\89831\Testimony - BAI\142676.DOC
