I. Background and Qualifications

Q. Please state your name, address, and affiliation.

A. My name is Pamela Morgan. My address is 17 Masaryk, Lake Oswego, Oregon 97035. I am President of Graceful Systems, LLC, the company I formed after I finished my 20-plus year career at Portland General Electric (PGE). Graceful Systems helps stakeholders in the energy utility system engage in collaborative processes to explore, understand, and develop generative strategy in response to complex challenges and opportunities. Because these complex challenges and opportunities are dynamic across time and space, and interrelate with many other challenges and opportunities, there is no single solution or path to success. Rather, stakeholders need practices by which they collectively can see current reality, loosen old ideas to make room for innovation and creativity, and adjust continually their collective actions to improve progress toward overcoming the challenges and seizing the opportunities.

Through Graceful Systems and often in partnership with others, I have engaged in diverse activities ranging from the development and delivery of a systems thinking training program for energy utility regulatory agencies, to assisting a Commission with a collaborative review and assessment of its resource planning and procurement practices. I have also appeared as an expert witness for the Natural Resources Defense Council (NRDC) on a number of occasions and participated in their work on national energy policy issues of importance to electric utilities, including a major review of the results of decoupling policies nationwide.

1 **Q. What are your educational background and professional qualifications to appear in this**
2 **proceeding?**

3 A. I am a graduate of Washington State University and the University of Washington
4 School of Law. I first entered the energy utility field in 1984, representing industrial
5 customers of electric and natural gas utilities in the Pacific Northwest. In 1986, I joined PGE
6 as Associate General Counsel. I held a variety of positions at PGE concerned with
7 regulation, becoming Vice President of Regulatory Affairs in 1996. I briefly left PGE in
8 1997 to work for a software and services company called ConneXt. I re-joined PGE in 1999
9 as Vice President of Regulatory Affairs, responsible for state and federal economic
10 regulation, among other things, including strategy as of 2004. During my years in
11 Regulatory Affairs, I worked on many matters pertinent to this docket, including:

- 12 • The preparation and review of Integrated Resource Plans, including
13 renewable resources;
- 14 • Design and approval of energy efficiency programs;
- 15 • All aspects of cost recovery related to energy efficiency, including the
16 collaborative development of a decoupling mechanism that was in place
17 for PGE during 1995 and 1996;
- 18 • The development of regulatory guidelines on competitive bidding and
19 subsequent Requests for Proposals done by PGE under those guidelines;
- 20 • The development and filing of avoided costs;
- 21 • All cost recovery and rate-related matters, including revenue requirement,
22 rate spread, and rate design;
- 23 • Regulatory accounting; and

- 1 • Cost of capital, including the issue of imputed debt from long-term
2 contractual commitments.

3 In addition, my roles in Regulatory Affairs, Strategy, and Government Affairs
4 required that I be conversant with many electricity and energy policy issues, including those
5 involved in these dockets. For NRDC, I have appeared as a witness in cases in Iowa,
6 Indiana, Michigan, and Missouri.

7 **Q. On whose behalf are you testifying?**

8 A. I am appearing for NRDC, a party to this case.

9 **Q. Have you previously testified before this Commission?**

10 A. Yes, I testified as an expert witness for NRDC in File No. ER-2010-0036.

11 **Q. What materials have you reviewed in preparation of this testimony?**

12 A. I have reviewed all of the direct testimony filed by Ameren Missouri in this docket,
13 with particular attention to the testimonies of Warner Baxter, John Reed, and Wilbon Cooper.
14 I also reviewed documents from File No. EO-2012-0142, Ameren Missouri's Missouri
15 Energy Efficiency Investment Act (MEEIA) filing, pertinent to the issues on which I am
16 testifying.

17 **II. Summary of Recommendations**

18 **Q. On what issues in Ameren Missouri's rate case filing will you be testifying?**

19 A. My testimony addresses two rate design issues:

1. Ameren Missouri has proposed to increase the fixed billing cycle customer charge for both the residential and small general service (non-demand-metered) customer classes. For residential customers, the proposed increase is from the current \$8 to \$12 per billing cycle, a 50 percent increase. For small general service customers, the proposed increase is from \$9.74 to \$14.91 per billing cycle for single phase service and from \$19.49 to \$29.24 per billing cycle for three phase service. Commission Staff's Cost of Service Study proposes increasing the residential customer charge to \$9 per billing cycle.
2. Ameren Missouri has not proposed to change the declining rate design it offers residential customers for winter use of electricity.

Q. What are NRDC's recommendations on these issues?

A. NRDC recommends that:

1. The Commission deny Ameren Missouri's and Staff's proposals to increase the residential customer charge and Ameren Missouri's proposal to increase the customer charge of the small general service class. The most important reason for denying this rate design change is that its effects are directly at odds with achieving the state's goal of capturing all cost-effective energy efficiency. Increasing the customer charge lengthens the payback period that customers face in making energy efficiency investments. Ameren Missouri's own studies show that this has a negative effect on savings. In addition to this compelling policy reason for rejecting the proposed rate design change, few traditional rate design considerations support it. Shifting costs out of the variable charge weakens the

effectiveness of its price signal, contrary to evidence that suggests rising costs. The cost study evidence is conflicting and cost studies ignore important intra-class equity questions. The rate design change will shift costs and, thus, undercut rate stability and predictability. Finally, the change is not necessary to improve revenue stability for Ameren Missouri. This rate design change will not affect Ameren Missouri's disincentives to engaging in energy efficiency programs because the net shared benefits mechanism (referred to as "Ameren Missouri's TD-NSB Share") approved by the Commission in its order approving the unanimous stipulation and agreement in File No. EO-2012-0142 already fully protects Ameren Missouri from the throughput problem. Commission Staff's observation that surrounding utilities have higher customer charges offers no support for raising the charge to Ameren Missouri's customers, particularly given the negative consequences of doing so. The proposal is harmful, unnecessary and unsupported by evidence in the record of this case.

2. The Commission should order Ameren Missouri to engage in further work on the declining block rate design issue, so that parties and the Commission may re-engage with this issue in a broad-based review of Ameren Missouri's rate spread and designs or in Ameren Missouri's next general rate case.

III. The Commission Should Reject Proposals to Increase the Fixed Charges for Residential and Small General Service Customers

Q. How are the effects of Ameren Missouri's rate design changes directly at odds with achieving the state's goal expressed in MEEIA of implementing programs to achieve "all cost-effective demand-side savings" (393.1075.4, RSMo)?

1 A. The proposed shift of costs from variable to fixed charges is likely to reduce
2 residential and small general service customer participation in utility energy efficiency
3 programs and, thus, reduce the state's capture of all cost-effective energy efficiency.

4 Under the design of most energy efficiency programs, including those approved in
5 Ameren Missouri's MEEIA case (File No. EO-2012-0142), the utility offers incentives that
6 cover only a portion of the upfront cost involved in increasing energy efficiency. There are
7 good reasons for this because energy efficiency both benefits all customers by postponing
8 utility investments in increased capacity to meet the entire customer base's needs, and the
9 individual investing customers by lowering the monthly utility bills they incur in achieving
10 their energy-related outcomes. These utility bill savings are an important financial and
11 psychological benefit to customers participating in utility programs. Shifting costs from
12 variable, kilowatt-hour charges to the fixed customer charge lessens this benefit by reducing
13 customers' ability to save on their bills by conserving electricity. As a result, customers
14 deciding to participate in the programs will see less upfront benefit from the energy
15 efficiency investment they make. Participating customers will still see benefits, but their
16 monthly bill savings will be smaller and it will take longer for them to recoup the upfront
17 costs of energy efficiency investments. In other words, the payback period will increase.

18 **Q. Do Ameren Missouri's own energy efficiency market potential studies show that**
19 **payback periods matter to customer participation in utility energy efficiency programs?**

20 A. Yes. Ameren Missouri's studies echo the findings of extensive research showing that
21 customers are reluctant to invest in efficiency unless the payback period they experience will
22 be very short. The concept of payback guides everything from measure selection to program

1 design. For example, Ameren Missouri’s 2010 DSM market potential study defines
2 “maximum achievable potential” (MAP) as the level of energy efficiency that customers
3 would be expected to achieve if the payback periods they could expect on energy efficiency
4 and demand response investments were only one year. The “realistically achievable
5 potential” (RAP) was defined as the level of DSM savings expected with three-year payback
6 periods.¹ The Ameren Missouri analysis showed that more customers would participate in
7 programs with shorter payback periods (MAP) than with longer payback periods (RAP).² As
8 a result, the reduction in energy savings from MAP to RAP was approximately 50 percent, a
9 significant drop in energy efficiency potential.³

10 **Q. What would Ameren Missouri’s options be for meeting the energy savings targets in the**
11 **approved MEEIA settlement agreement if a higher customer charge lowers customer**
12 **participation and energy savings?**

13 A. Ameren Missouri’s primary option would be to offer higher financial incentives that
14 return customer payback periods to what they would have been before the customer charge
15 increase. Unfortunately, this response would have negative effects on both customers and
16 Ameren Missouri. Customers would pay more for programs that are less cost-effective
17 (fewer energy savings per dollar spent) and would receive fewer overall benefits because
18 program budgets would not stretch as far. Ameren Missouri will also experience greater
19 difficulty achieving its targeted energy savings under its approved program budgets.

20 Because Ameren Missouri’s performance award is defined as a percentage of the net benefits

¹ Global Energy Partners, LLC, AMERENUE DEMAND SIDE MANAGEMENT (DSM) MARKET POTENTIAL STUDY: VOLUME 1, Global Report No. 1287-1, January 2010, at ES-20.

² *Id.*, at ES-20.

³ *Id.*, at ES-3, ES-5, ES-7.

1 from its MEEIA programs, an increase in program costs (which corresponds to a decrease in
2 net benefits since net benefits are defined as utility avoided costs net of program costs) will
3 also reduce the dollar value of Ameren Missouri's performance award.

4 **Q. Is the rate design proposal's interference with state energy policy the only reason the**
5 **Commission should deny the shift of costs to the customer charge?**

6 A. No. There is a long-standing set of considerations that regulators have traditionally
7 applied in establishing energy utility rate designs. In this case, these considerations either do
8 not support the change, support it only weakly, or cannot be applied because Ameren
9 Missouri has presented no evidence through which parties and the Commission could apply
10 the consideration.

11 **Q. Based on your experience, which of the considerations typically applied in establishing**
12 **rate design are important to the issue in this case?**

13 A. The classic guide on rate spread and design to which I have turned throughout my
14 career is the Principles of Public Utility Rates, by James C. Bonbright. In various editions,
15 he describes between eight and ten considerations that are important. The ones I find
16 applicable here are these, paraphrased in my own words:

- 17 1. Quality of the price signal concerning the near-, medium- and long-term cost of
18 using electricity and the highly related effect of price on a customer's willingness
19 to invest in structural changes, appliances or equipment that preserve the
20 customer's desired outcome(s) at a lower use of electricity;
- 21 2. Stability and predictability in revenues from the utility's perspective;

1 3. Stability and predictability in bills from the customers' perspective;

2 4. Fairness between broad groupings of customers (classes) and within a given
3 customer grouping.

4 **Q. How does consideration of price signal quality inform your recommendation against**
5 **raising the residential and small general service customer charges?**

6 A. For residential and small general service customers, monthly bills depend largely on
7 the amount of electricity they use in the billing cycle. The more electricity customers use,
8 the larger their bill. The industry relies on this result to signal to customers that higher usage
9 triggers greater cost, both in the short-term because of variable costs such as fuel and in the
10 long-term by triggering need for new investment that almost inevitably will cost more than
11 the depreciated amount of the investment in rates at the time the new investment occurs.

12 Shifting cost recovery to fixed charges weakens this signal. Under this scenario,
13 customers with relatively lower levels of electricity use will now pay more, with the revenues
14 being shifted from customers with relatively higher levels of use, because fewer costs are
15 linked to the customer's direct electricity use. As a result, the effective rate for higher levels
16 of use is also lower than it would have been without the customer charge increase.

17 Regardless of time frame, and whether specific to Ameren Missouri or more general in the
18 environment, there is nothing to support weakening the price signal with respect to high
19 monthly levels of electricity use.

20 It is critically important to signal to customers that increased use leads to increased
21 cost. For example, in his overview of the case, Warner Baxter emphasizes the large
22 investment needs facing the utility in the near-term. He states, "While we have certainly

1 made investments in the past to address, at least in part, our aging infrastructure, the bow
2 wave of investment needs continues to grow.” (Baxter direct, page 16, 20–21) These
3 investment needs will be higher if customers do not receive clear price signals about the costs
4 of higher electricity use. Another driver of the rate case is the rising cost of coal and other
5 fuels, variable inputs that likewise point to the need for usage-based price signals. (Baxter
6 Direct, page 7, line 21, through page 8, line 2) Further, while natural gas prices are currently
7 low, few expect those prices to persist. The last several decades have taught us that natural
8 gas prices are extremely volatile; even if long-term forecasts show modest straight-line
9 escalation in natural gas prices, that is unlikely to be what utilities and their customers
10 actually experience. Thus, price signals are also critical in the case of electricity sourced
11 from gas-fired plants.

12 **Q. Does the consideration of price signals relate to customer willingness to make**
13 **investments to increase energy efficiency?**

14 A. Yes, intuitively customers are more likely to have interest in making energy
15 efficiency investment if they believe that electricity prices in the future will be higher than
16 today.

17 **Q. Could this customer charge increase result in mixed messages to customers?**

18 A. Yes, obviously the financial message is mixed. If this proposed rate design change
19 takes effect, customers using relatively less electricity than others within the residential and
20 small general service classes will experience higher rate increases than customers using
21 relatively more. Ameren Missouri will undoubtedly need to engage in some public relations
22 effort to explain its reasons for making the change to the customers most affected by the

1 increased customer charge. It is difficult to imagine an explanation that will not raise doubt
2 or at least confusion about the future rising trajectory of electricity costs. For a period during
3 which Ameren Missouri is proposing to spend nearly \$150 million of ratepayer funds to help
4 its customers increase their energy efficiency and use less electricity, it seems
5 counterproductive that it must also explain why using less will now cost you more.

6 **Q. How does consideration of stability and predictability in utility revenues affect your**
7 **recommendation on the proposed rate design change?**

8 A. I do not see this as a significant consideration in this case, particularly given that
9 Ameren Missouri presented no evidence of the amount of revenue the rate design change
10 would make more predictable nor how variable this revenue has been. Any shift of cost
11 recovery from variable to fixed charges increases the utility's revenue stability and
12 predictability. In this manner, increasing monthly fixed charges operates much like a
13 decoupling mechanism. A decoupling mechanism, however, operates independently of rate
14 design. Such a mechanism requires the utility to return any revenue in excess of the amount
15 set by the operation of the mechanism or to collect any revenue under this amount. The rate
16 designs under which customers pay for electricity are not affected and, indeed, one could pair
17 adoption of a decoupling mechanism with rate design changes that shift costs out of fixed
18 charges into variable charges to improve price signals and encourage customer participation
19 in energy efficiency. In my experience, the consideration of predictability and stability in
20 utility revenues is best addressed by a decoupling mechanism, which enables the
21 Commission and stakeholders to set rate design in the manner most aligned with state policy.

1 **Q. Is this rate design change necessary to remove Ameren Missouri’s disincentive to**
2 **support the MEEIA energy efficiency programs on which it plans to spend \$150**
3 **million?**

4 A. My understanding is that it is not necessary for this purpose. The parties in File No.
5 EO-2012-0142 have reached a settlement, which the Commission has approved, through
6 which a net shared benefits mechanism (referred to in the settlement as “Ameren Missouri’s
7 TD-NSB Share”) will hold Ameren Missouri harmless from losing fixed cost-related
8 revenues as a result of its energy efficiency programs. Accordingly, the rate design change
9 that Ameren Missouri proposes in the current rate case is not necessary to remove barriers to
10 Ameren Missouri’s pursuit of energy efficiency.

11 **Q. How do the considerations of customer bill predictability and stability and intra-class**
12 **equity affect your recommendation?**

13 A. The short answer to this question is that we do not know because Ameren Missouri’s
14 case presents no evidence on these matters.

15 Considering customer bill predictability and stability would require information on at
16 least 12 months of bills before and after the change, which I did not find in the filing.
17 Information on Ameren Missouri’s expectations of the customer consequences – both
18 desirable and undesirable – of the proposed rate design change is also missing. The complete
19 lack of testimony on these issues makes it difficult to assess the proposal from the
20 perspective of stability and predictability to customers. Moreover, even if this information
21 showed that bills will vary less after the rate design change – an intuitive result given that a

1 large portion is now fixed – this consideration competes with consideration of price signals
2 and, in this case, loses to overriding state policy.

3 Considering intra-class equity requires information on a number of matters,
4 including:

- 5 • How many customers within the residential and small general service classes will
6 experience a greater than class average rate increase as a result of the proposed
7 increases in the customer charges;
- 8 • At what levels of usage these customers will experience an increase and how
9 large such increases will be;
- 10 • The characteristics of the customers using relatively lower amounts of electricity,
11 including income levels, size of residence or business, and prior investments in
12 energy efficiency.

13 The filing contains none of this information.

14 While Ameren Missouri does support the proposed rate design with its cost of service
15 study, Commission Staff and Public Counsel provide competing cost of service studies which
16 show far lower numbers. Just looking at the residential class, Ameren Missouri identifies the
17 costs appropriately allocated to the customer charge to be \$20 per billing cycle; Commission
18 Staff finds them to be approximately \$9; and Public Counsel’s cost of service study finds
19 them to be under \$6. Methodology matters to the study outcome but I am not certain it helps
20 us ascertain truth.

1 These studies also show that most of the effort involved is for inter-class cost
2 allocation between customer classes, rather than within a class. The studies provide less
3 insight on equity within a class, where differences in when, how much and where class
4 members use electricity surely produce cost differences. For many of these differences, we
5 lack the data to assess and allocate the costs involved. The residential and small general
6 service classes affected by the proposed rate design change do not have demand meters.
7 Accordingly, we do not know who among these classes most contributes to system peak and
8 who has better or worse load factors. We also know that different locations in a utility's
9 service territory cost different amounts to serve and, by historical practice, we ignore those
10 differences in favor of postage stamp rates. Finally, we know that the combined effects of
11 inflation and depreciation mean that customers more recently added to the system probably
12 are "responsible" for relatively larger amounts of the net rate base than customers on the
13 system for many years but we also ignore this difference. For all of these reasons, reliance
14 on cost of service studies in support of rate design changes, as opposed to rate spread
15 decisions, is problematic. Cost of service is not solid support for the proposed rate design
16 change, particularly given the need to consider price signals and the overriding state policy
17 for energy efficiency, which the change undercuts.

18 **Q. Did Professor Bonbright provide any general guidance on rate design matters that you**
19 **find applicable in this instance?**

20 A. Yes. I find the following quote from the 1960 edition of his Principles of Public
21 Utility Rates particularly insightful here:

22 "[R]ate-structure problems are far more complex than problems of a fair
23 return even though the latter are by no means elementary; and they are even

1 less amenable to solution by reference to definite principles or rules of rate
2 making. . . . In part it is due to the inability of the rate maker to predict the
3 effect of changes in rates on demand for the services and hence on costs of
4 supply – due, in short, to ignorance of demand functions and cost functions.
5 But in part – and this is the most serious theoretical difficulty – it is due to the
6 necessity, faced alike by public utility managements and by regulating
7 agencies, of taking into account numerous conflicting standards of fairness
8 and functional efficiency in the choice of a rate structure. . . . No rational
9 discussion, . . . , of the relative merits of ‘cost of service’ and ‘value of service’
10 as measures of proper rates or rate relationships is possible without reference
11 to the question what desirable results the rate maker hopes to secure, and what
12 undesirable results he hopes to minimize” (pages 288–290)
13

14 Rate design decisions are complex. Proposals to make large increases in the fixed
15 charges deserve more effort and scrutiny than Ameren Missouri and Commission Staff,
16 respectively, provide. The proposed increases in fixed customer charges raise intra-class
17 equity issues, send the rate design price signal in a direction opposite from the direction of
18 costs, result in unknown impacts to individual customers within the classes, and are contrary
19 to Missouri’s state energy efficiency goals. Accordingly, I recommend that the Commission
20 deny Ameren Missouri’s and Staff’s proposals to increase the residential customer charge
21 and Ameren Missouri’s proposal to increase the customer charge of the small general service
22 class.

23 **IV. The Commission Should Order Ameren Missouri to Support or Propose a**
24 **Transition Away from its Residential Declining Block Rates in its Next**
25 **Rate Case or as part of a Broad Rate Spread/Design Review**

26 **Q. Do Ameren Missouri’s proposed tariffs in this case include a declining block rate**
27 **design?**

1 A. Yes. Both the residential and small general service tariffs include a declining block
2 design for winter rates.

3 **Q. What is your opinion regarding use of declining block rates in this second decade of the**
4 **21st century?**

5 A. I share the Commission's view that declining block rates do not send a proper price
6 signal and tend to encourage the excessive consumption of electricity. (File No. ER-2010-
7 0036, Order at page 122) Put in place in the days before organized wholesale markets such
8 as MISO, when utilities built generation for the summer peak and could do little with the
9 capacity during the lower usage winter period, this rate design encouraged retail sales that
10 contributed to fixed cost recovery and, at least theoretically, lowered rates for everyone.
11 Moreover, electric utilities requested these rate designs to compete with natural gas
12 companies for winter space heating load. The situation today is different. The ability to sell
13 temporarily excess generation on the wholesale market provides the retail customer base with
14 some relief from bearing the entire fixed cost of generation built to serve a once-a-year peak.

15 The time has come to re-examine the economics, equity, and policy of declining
16 block rates. While I believe this rate design cannot withstand such examination, our
17 practices require that we make the effort before making the change.

18 **Q. Who can provide the information necessary to enable such a review of declining block**
19 **rates?**

20 A. Virtually all parties can opine on policy and note broad environmental conditions that
21 weigh against maintaining these consumption-inducing rate designs. The only organization
22 that can provide the information needed to look at economics and equity, however, is the
23 utility. Some of the questions to which it has the necessary data are:

- What is the likely market value (and thus, opportunity cost) of electricity in the winter months?
- How many customers have usage into the second block, when, and who are these customers? How many have electric space heat? Are they good candidates for energy efficiency programs? What would various transition plans look like?

Unfortunately, if the Commission waits for some party other than Ameren Missouri to come forward with this information, it is likely to be waiting a long time.

Q. How would you recommend this review of the declining block rate design occur?

A. My recommendation would be that the Commission open a separate docket to look at rate design generally, addressing the declining block as part of a broad look at the basic rates that are most likely both to provide customers good price signals and to act as a base for innovation. Many of the current issues in this industry – customer-sided distributed generation, electric vehicles, demand response, Smart Grid – implicate both the services a utility offers and the prices it charges for those services. It is no longer just about kilowatts and kilowatt-hours. We need to identify the range of utility services, consider which could or should be optional alternatives or add-ons to the basic service, and which could be competitive, and price everything to achieve identified objectives. As Professor Bonbright noted, the most important questions for the rate-maker is what desirable results he or she wants to see and what undesirable results he or she hopes to minimize.

1 Alternatively, I encourage the Commission to order Ameren Missouri to address the
2 declining block rate design in its next general rate case and either support it or propose a
3 transition plan to eliminate it.

4 **Q. Does this complete your testimony?**

5 A. Yes, it does.

BEFORE THE PUBLIC SERVICE COMMISSION

AFFIDAVIT OF PAMELA G. MORGAN

Pamela G. Morgan, of lawful age, on her oath states: that she has participated in the preparation of this testimony in question and answer form consisting of 18 pages to be given as Rebuttal Testimony in the above-named case; that the answers were given by her and that she has knowledge of the matters set forth in such answers; and that such matters are true to the best of her knowledge and belief.

Pamela G. Morgan

att In witness whereof I have hereunto subscribed my name and affixed my official seal this
day of August, 2012.

Notary Public, state of Oregon
