MISSOURI PUBLIC SERVICE COMMISSION

CASE NO. ER-2019-0335

REBUTTAL TESTIMONY

OF

EMILY PIONTEK

ON BEHALF OF

RENEW MISSOURI

January 21, 2020

BEFORE THE PUBLIC SERVICE COMMISSION OF THE STATE OF MISSOURI

)

٢

In the Matter of Union Electric Company d/b/a Ameren Missouri's Tariffs to Decrease Its Revenues for Electric Service.

File No. ER-2019-0335

AFFIDAVIT OF EMILY PIONTEK

\$\$

STATE OF MISSOURI)) COUNTY OF BOONE)

COMES NOW Emily Piontek, and on her oath states that she is of sound mind and lawful

age; that she prepared the attached rebuttal testimony; and that the same is true and correct to the

best of her knowledge and belief.

Further the Affiant sayeth not.

Emily Piontek

Subscribed and sworn before me this 21st day of January 2020.

Notary Public

My commission expires: 8-16-23

V. Recommendation and response to Ameren	19

1 I. Introduction

2 Q. State your name, business name, and address.

A. My name is Emily Piontek and I am a Policy Research Clerk at Renew Missouri
Advocates, Inc. ("Renew Missouri") located at 409 Vandiver Drive, Suite #5- 205,
Columbia, Missouri 65202.

6 Q. On whose behalf are you appearing in this case?

A. I am appearing as a witness on behalf of Renew Missouri, a 501(c)(3) focusing on
renewable energy and energy efficiency policy in the State of Missouri.

9

Q. What are your qualifications in commenting on this rate case?

I have served as a renewable energy policy researcher for Renew Missouri since May of A. 10 2018. In my time at Renew Missouri, I have appeared as a witness before the House 11 Utilities Committee to testify in favor of securitization legislation, I have assisted with 12 comments delivered by Renew Missouri on the Integrated Resource Plans of all the 13 14 investor-owned utilities in the state, and have conducted a broad range of research on renewable energy and energy efficiency issues pertinent in Missouri. Additionally, I have 15 earned a Graduate Certificate in Public Policy from the Truman School of Public Affairs 16 at the University of Missouri and will graduate with a Masters of Science in Human 17 Dimensions of Natural Resource Management from the School of Natural Resources at 18 the University of Missouri-Columbia in May 2020. My Master's research is centered on 19 the intersection of environmental and social justice, and has been presented at the 2019 20 National Environment & Recreation Research Symposium as well as accepted for 21 presentation at The Academy of Leisure Sciences 2020 Conference. Additionally, my 22

1		research has been submitted for publication in the journal, Urban Forestry & Urban
2		Greening. In 2012, I earned my B.A. in History and in Political Science from Washington
3		University.
4	<u>II. Pu</u>	rpose of Testimony & Summary of Conclusions
5	Q.	What is the purpose of your rebuttal testimony?
6	A.	The purpose of my rebuttal testimony is to respond to proposed changes to the residential
7		tariff of Ameren Missouri (sometimes referred to as "Ameren" or "the Company"
8		depending on the context.). Specifically, I am responding to the direct testimony of Dr.
9		Ahmad Faruqui who supports the Company's proposed tariff as well as the direct
10		testimony of Company president Steve Wills on residential customer charges, including
11		time of use ("TOU") rates and demand charges.
12	Q.	What conclusions have you drawn regarding the proposed tariff?
13	A.	The proposed rate changes do accommodate certain sound principles for rate design.
14		Modernized rate design that implements TOU pricing can potentially assign the cost of
15		electric service to customers more efficiently and more equitably. However, the
16		Company should remove the demand charge from its residential rate pilot, or
17		"Residential Ultimate Saver Service" (R - TOUUS). Although applicable to commercial-
18		class electric customers, demand charges are inappropriate for the residential customer
19		class. Extensive research implemented by utilities across the country shows how TOU
20		rates smooth peak load by shifting and - in some cases - reducing customer electric usage.
21		The TOU rates should be sufficient without resorting to problematic demand charges.

I describe them as problematic because, despite numerous pilot tests in utility 1 service territories from across the United States, little evidence exists to suggest 2 residential demand charges meet the sound principles of modern rate design (e.g., equity, 3 efficiency; see p.6 of this testimony for further discussion). For example, demand charges 4 likely impose a substantial burden on vulnerable populations such as low-income 5 6 households, households with young children, customers with disabilities, and seniors. Furthermore, demand charges are not tied to meaningful customer behavior change in 7 regards to energy efficiency or energy conservation patterns. As demand charges do not 8 9 have the intended price-signaling effect that would lead customers to implement changes in their energy usage, demand charges are an improper course of action for the Company. 10

11

III. Residential rate changes

12 **Q**. Why does the company believe it is necessary to redesign its residential rates?

A. Utilities across the country are moving to modernize their rate designs to better reflect the 13 actual costs of generating electricity. Modern technologies such as "smart" appliances, 14 15 residential net-metered solar, and electric vehicles have altered the consumption patterns of individual electric customers. This technology can facilitate customer responses to 16 price signals. Electric utilities are moving away from volumetric rate designs, which 17 poorly reflect the actual costs of generating power and supplying the consumer across a 18 particular customer class. The total cost incurred by the utility in providing power and 19 servicing its customers can be subdivided into categories: customer-related, demand-20 21 related, and energy-related. Generation, distribution, and transmission costs are typically included in, and recovered by, the volumetric charge for a specific customer class. 22 However, these charges are not directly related to fees assessed through a customers' bill. 23

Therefore, the relationship between energy-related and demand-related charges is not
 clear to a customer under a volumetric rate.

Additionally, utilities are increasingly taking advantage of advanced metering infrastructure (AMI) that enables modern and more sophisticated cost recovery.¹ Traditional volumetric pricing structures, which utilize high customer charges and straight fixed variable rates, reduce customer incentives to conserve energy or to use energy more efficiently and ultimately reduce the ability of the customer to contribute to demand-side management. Since AMI is crucial to TOU rates, this technology makes such rate design more feasible.

In 2019, Ameren Missouri filed a requests for (1) a Waiver of Various Tariffs 10 11 and Regulations to Enable the Deployment of Automated Metering Infrastructure Beginning in 2020 (Case# EE-2019-0382) and (2) a Waiver of Meter Testing 12 13 Requirements in Anticipation of Automated Metering Infrastructure Deployment 14 Beginning in 2020 (Case# EE-2019-0383). AMI leads to system-wide benefits, including a more balanced load distribution throughout the day that shifts customer use from peak 15 to non-peak hours.² Smart meters provide real-time data on customer electric usage, 16 allowing the utility to collect a time-varied rate. Two-way smart meters fitted with a 17 customer-facing monitor even give customers access to their electric consumption data. 18 Ultimately, AMI allows an entire customer class to shift its overall usage pattern as those 19 20 customers respond to price signals accordingly.

¹ Regulatory Assistance Project, <u>Smart Rate Design for a Smart Future</u>, July 2015, p. 15, *available at* <u>http://www.raponline.org/wp-content/.../rap-lazar-gonzalez-smart-rate-design-july2015.pdf</u>

² Rocky Mountain Institute, <u>A Review of Alternative Rate Designs</u>, May 2016, p. 54, *available at* <u>https://rmi.org/insight/review-alternative-rate-designs/</u>

1		Based on the price signals available through AMI technology, customers can
2		experience billing fluctuations and the utility will see an altered load pattern throughout
3		the day. For example, say a utility sets a TOU rate with a high peak price during system-
4		peak hours of 3PM - 6PM Monday through Friday and complements that with a low off-
5		peak price. Customers who shift electric consumption to before 3PM or to after 6PM will
6		be assessed for that usage at the lower off-peak price, which may cause their electric bill
7		to be reduced overall if all other things remain equal. However, if that customer does not
8		shift electric use from the peak period, then (if all other things remain equal) their overall
9		bill will increase due to the higher rate assessed for that peak-period usage. Based on
10		customer response and behavior, the utility will see peak load smoothing if customers do
11		in fact reduce consumption at peak times. There is no guarantee peak load smoothing will
12		occur, particularly if TOU rates are assessed over non-coincident peak periods, or do not
13		provide actionable price signals. ³ In other words, TOU rates – like any other rates - must
14		be designed and implemented soundly.
15	Q.	What changes to its rate design does Ameren propose?
16	A.	In addition to maintaining its traditional residential rates model ("R-Basic"), the
17		Company proposes a series of small opt-in pilots that will differently allocate the costs of
18		producing and supplying power. Currently, the Company offers basic residential service
19		("R-Basic") across its service territory that utilizes (1) a fixed, basic monthly service
20		charge and (2) a monthly energy charge based on usage (kWh) that varies seasonally, but
21		not otherwise by time-of-use or demand. In addition to continuing to offer this existing
	³ Sout	hern Environmental Law Center. A Troubling Trend in Rate Design: Proposed Rate Design Alternatives to

³ Southern Environmental Law Center, <u>A Troubling Trend in Rate Design: Proposed Rate Design Alternatives to</u> <u>Troubling Fixed Charges</u>, December 2015, *available at: <u>https://www.southernenvironment.org/uploads/news-</u> <u>feed/A_Troubling_Trend in_Rate_Design.pdf</u>*

residential rate, the Company proposes three separate modifications to this rate design. In 1 this case, the company proposes two optional rates ("R-TOU" & "R-TOUEV") that each 2 utilize (1) a basic monthly service charge, and (2) a monthly energy charge based on 3 usage (kWh) that varies seasonally and by time-of-use. R-TOU utilizes a three-part TOU 4 rate composed of on-peak, off-peak, and intermediate pricing periods, and is only 5 available to customers already fitted with AMI. R-TOUEV utilizes a two-part TOU with 6 on-peak and off-peak pricing periods. Unlike R-TOU, R-TOUEV is available to 7 customers who are not currently fitted with AMI; however, in such an instance, an 8 9 additional monthly service charge will apply. Finally, the Company proposes an opt-in pilot program ("R-TOUUS") that implements a fixed charge, a demand charge, and a 10 TOU rate to participating customers. See Table 1 for a basic comparison of each optional 11 tariff. 12

13

Table 1. Cost components for R-TOU, R-TOUEV, & R-TOUUS

1	4

Charge Description		Tariff	
Customer service charge(s)	Monthly, non-varying service charge.	 R-TOU R-TOUEV* R-TOUUS	
Energy charge	Variable; based on time-of day, season, & kW used.	 R-TOU R-TOUEV R-TOUUS	
Demand charge	Variable; based on time-of-day, season, & kW used during demand billing period.	• R-TOUUS	

15

*Additional monthly service of \$1.50 charge will apply to customers without AMI.

16 Q. Please describe the R-TOUUS tariff in more detail.

1	А.	As proposed, R-TOUUS introduces a three-part rate that includes (1) a basic service
2		charge, or "fixed" charge, to cover the incremental cost of providing service to each
3		additional customer (e.g., meter, postage, etc.); (2) an energy charge that will vary (a)
4		seasonally (four summer months of June - September and eight winter months from
5		October - May) and (b) by on-peak and off-peak hours that also vary seasonally; and (3) a
6		monthly demand charge, which will be assessed on the customer's maximum usage over
7		the course of one hour from the period between 6am and 10pm. ⁴ In Table 2 ("Mapping of
8		Cost Categories to Rate Elements", p.26) of his direct testimony, Mr. Wills shows the
9		purpose of the demand charge in the tariff TOUUS is to allocate the demand costs of
10		producing and distributing power. This charge will be assessed differently by season
11		(summer vs. non-summer) and by period (peak vs. non-peak). See Table 2.

Table 2. Cost components of R-TOUUS

Charge	Objective		Rate
Customer service charge	Recover customer-related costs (e.g., postage, billing).	\$11.00/month	
Energy charge	Recover energy-related costs (based on time-of day, season, & kW used)	Summer Peak: 25.15¢/kWh Winter Peak: 14.05¢/kWh	Summer Off-peak: 4.27¢/kWh Winter Off-peak: 3.89¢/kWh
Demand charge	Recover demand-related costs (e.g., production & distribution)	Summer: \$6.86/monthly kW of billing demand	<i>Winter:</i> \$2.93/monthly kW of billing demand

13 Q. Please describe the differences between R-TOU and R-TOUEV.

⁴ See Tariff Revision (YE 2020-0001), Sheet No. 54.10-54.12. Missouri Public Service Commission, Docket No. ER-2019-0335.

1	The Company is also proposing an optional tariff for residential customers already fitted
2	with advanced meters. ⁵ R-TOU, or "Residential Smart Saver Service," utilizes a two-part
3	rate that also includes (1) a basic service charge or "fixed" charge to cover the
4	incremental cost of providing service to each additional customer (e.g., meter, postage,
5	etc.); (2) an energy charge that will vary (a) seasonally (four summer months of June -
6	September and eight winter months from October - May) and (b) a three-tired Time-of-
7	Use rate that varies seasonally according to on-peak, intermediate peak, and off-peak
8	hours. R-TOU does not include a demand charge. See Table 3.

Table 3.	Cost	components	of R-TOU
----------	------	------------	----------

Charge	Objective		Rate	
Customer service charge	Recover customer-related costs (e.g., postage, billing).	\$11.00/month		
Energy charge	Recover energy-related costs (based on time-of day, season, & kW used)	Summer Peak 3pm - 7pm 32.14¢/kWh	<i>Summer</i> <i>Intermediate</i> 6am - 10pm 8.45¢/kWh	<i>Summer</i> <i>Off-peak</i> 10pm - 6am 5.37¢/kWh
		Winter Peak	Winter Intermediate	Winter Off-peak
		6am - 8am 6pm - 8pm 16.36¢/kWh	6am - 10pm 5.90¢/kWh	10pm - 6am 4.78¢/kWh

Additionally, the Company proposes another optional tariff for residential customers that 11 will require advanced meters. As does R-TOU, R-TOUEV utilizes a two-part rate that 12 also includes (1) a basic service charge or "fixed" charge to cover the incremental cost of

⁵ Customers who opt-in to R-TOU will have two service options to choose from: (1) Option A = year round or (2) Option B = summer seasonal billing under the R-TOU rate & winter seasonal billing under R-Basic.

providing service to each additional customer (e.g., meter, postage, etc.) and (2) an
energy charge that will vary seasonally (four summer months of June - September and
eight winter months from October - May). However, this Time-of-Use rate is only twotiered and will vary seasonally according to on-peak and off-peak hours. R-TOU does not
include a demand charge. See Table 4.

6

Table 4. Cost components of R-TOUEV

Charge	Objective	Ra	ate
Customer service charge	Recover customer-related costs (e.g., postage, billing).	\$11.00/month	
Energy charge	Recover energy-related costs (based on time-of day, season, & kW used)	Summer Peak* 13.55¢/kWh	Summer Off-peak** 5.39¢/kWh
		<i>Winter Peak*</i> 16.36¢/kWh	Winter Off-peak** 4.78¢/kWh

7

*Peak pricing hours: 6am - 10pm; **Off-peak pricing hours: 10pm - 6am.

Based on the duration of the peak period and its coupling with intermediate or "shoulder" pricing
periods, R-TOU presents more opportunities for customers to respond to price signals than does
R-TOUEV. That makes it an optimal option.

11 IV. Rate Design Principles

12 Q. What are the traditional parameters that policymakers consider in rate design?

13 A. There are a number of traditional principles that policymakers use in developing electric

- 14 rates. Efficiency, fair apportionment of costs, and revenue requirements are key factors
- 15 around which such principles have been traditionally organized and are based on
- 16 Bonbright's <u>Principles of Public Utility Rates</u> (1961) and Garfield and Lovejoy's

principles from <u>Public Utility Economics</u> (1964). However, due to the changing nature of
 the electric grid and the increased penetration of distributed energy resources, including
 demand-side management (of which TOU and demand charge rates are a component),
 these traditional parameters must be expanded and modified.

Today's utilities rely on a mixed-resource portfolio that can generate power from 5 variable energy resources (e.g., wind and solar), as well as from customers themselves 6 (e.g., through net metering). Time-varied resources should be accounted for by time-7 8 varied rates that assign the costs of power and service proportionate to the amount of and time of - electric consumption.⁶ Notably, Karl Rábago (formerly of Pace Energy and 9 Climate Center, Pace Law School) writes that modern rates "must be designed to account 10 11 for the incentives they create for utilities, customers, and non-utility market participants".⁷ In regards to time-varied rates, including TOU and demand charges, 12 13 utilities must consider how effectively the structure of the rates signals or incentivizes a 14 customer to participate in demand-side management, rather than whether these rates meet revenue requirements alone. 15

The Rocky Mountain Institute suggests several key design choices for demand
 charge rates that reflect the Bonbright Principles for good design. Notably, such

- 18 principles ensure that (1) customers are able to connect to the grid for no more than the
- 19

cost of connecting to the grid, and (2) customers pay for power supply and grid services

⁶ Regulatory Assistance Project, "<u>Demand Charges: Pathway or Detour?</u>" webinar, December 10 2015, *available at* <u>https://www.raponline.org/event/demand-charges-pathway-or-detour-webinar/</u>

⁷ Rábago, K. R., & Valova, R. (2018). "Revisiting Bonbright's principles of public utility rates in a DER world." *The Electricity Journal*, 31(8), 9-13.

1		based on how much energy these customers use and when they use it. ⁸ Four of the
2		recommended eight are particularly applicable to rate efficacy: (1) Cost Components &
3		Allocation (which determines the magnitude of the demand charge price); (2) Peak
4		Coincidence (peak prices and hours); (3) use of a Ratchet Mechanism (which bases
5		demand charges upon maximum demand over customer's historic, or sometimes
6		seasonal, use); and (4) the presence of Enabling Technology that can affect the
7		customer's ability to respond to the price signals introduced by the rate.9
8	Q.	Please explain how these four principles apply to the rate design changes proposed
9		by the Company in R-TOUUS.
10		Of course. I believe this works better as visualized in a graph. See Table 5.

⁸ Regulatory Assistance Project, <u>Smart Rate Design for a Smart Future</u>, July 2015, p. 15, *available at* <u>http://www.raponline.org/wp-content/.../rap-lazar-gonzalez-smart-rate-design-july2015.pdf</u> ⁹Rocky Mountain Institute, <u>A Review of Alternative Rate Designs</u>, May 2016, p. 76, *available at* <u>https://rmi.org/insight/review-alternative-rate-designs/</u>

Principle	Definition	Example from R-TOUUS
Cost Components & Allocation	• Recovers customer-related, energy-related, & demand-related costs	 Service charge (monthly fee) Energy charge (per kWh) Demand charge (fee/kW of billing demand)
Peak Coincidence	 Recovers energy- related costs based on daily & seasonal use; based on peak prices & hours. 	 Energy charge (per kWh) Demand charge (fee/kW of billing demand) Each of these rates varies based on hourly & seasonal use.
Enabling Technology (AMI & "smart" appliances)	 Enables utility to recover costs based on time of energy use Enables customer to respond to price signals 	 Energy charge (per kWh) Demand charge (fee/kW of billing demand) <i>Each customer eligible for pilot will be equipped with AMI.</i>
Ratchet Mechanism	 Bases demand charges upon maximum customer demand during billing period 	• Not included in the design of the R-TOUUS demand charge.

Table 5. Rate design principles applied to R-TOUUS

2 Q. Are there policy risks to the R-TOUUS rate design changes proposed?

3 A. Yes. There is a potential the R-TOUUS tariff will result in negative impacts that include:

- 4 inequitable and burdensome impacts to vulnerable customers (e.g., low-income
- 5 households, households with young children, customers with disabilities, and seniors)¹⁰,
- 6 and detrimental impacts on energy efficiency and energy conservation, as load shifting

¹⁰ White, L. V., & Sintov, N. D. (2019). Health and financial impacts of demand-side response measures differ across sociodemographic groups. *Nature Energy*, 1-11.

2

does not equate with energy efficiency or conservation on its own. I will address these concerns in more detail below.

3 Q. How would demand charges impact vulnerable populations?

Demand charges have the potential to cause adverse economic and health impacts to 4 A. vulnerable customers, including to low-income customers, seniors, to households with 5 young children, and to customers with disabilities, who may be unable to manage highly 6 volatile recurring bills. In order to manage household utility bills, evidence shows 7 customers will reduce electrical usage at the expense of their heating and cooling needs.¹¹ 8 Customers with disabilities or with medical conditions may not be able to respond to 9 price signals at all, as medical devices may not be adaptable to peak period timing.¹² 10 Finally, residential demand charges are not sensitive to the system requirements among 11 diverse customer classes. For example, low-income customers are more likely to reside in 12 multi-family apartments, yet apartments historically have the lowest cost of service of 13 any customer class due to the fact that multiple units can be served through a single 14 delivery point.¹³ Despite their lesser demand upon the system, apartment dwellers may be 15 unfairly assigned demand-related costs in the R-TOUUS scenario.¹⁴ This will increase 16 costs to these customers when they literally can do nothing about it. 17

¹³ Lazar, J. (2016) "Use great caution in design of residential demand charge rates". Regulatory Assistance Project, *available at* <u>https://www.raponline.org/wp-content/uploads/2016/05/lazar-demandcharges-ngejournal-2015-dec.pdf</u>

¹⁴ Chernick, P., Colgan, J., Gilliam, R., Jester, D., LeBel, & M. Vote Solar. "Charge without a Cause? Assessing Electric Utility Demand Charges on Small Consumers." Electricity Rate Design Review Paper No.1, July 18, 2016, *available at* <u>https://votesolar.org/files/6414/6888/3283/Charge-Without-CauseFinal_71816.pdf</u>

Jim Lazar of the Regulatory Assistance Project believes TOU rates are a more
 equitable way to both recover system costs and shift customer behavior. If cost recovery
 and peak load smoothing are at the heart of the Company's proposed rate modifications,
 then the demand charge portion of the pilot should be dropped.

5

Q.

How would this demand charge impact system-wide energy usage?

A customer's period of highest usage isn't automatically associated with system peak so 6 A. impacts to the grid will not be coordinated with high electric usage on an individual 7 basis.¹⁵ Lazar calls demand charges a "second-best" approach to reducing demands upon 8 the system when compared to time-varying rates like TOU rate designs.¹⁶ According to 9 Lazar, demand charges were originally designed when the power system was more 10 uniform in composition and relied more fully on peaking power plants than it does today. 11 Additionally, demand charges only approximate a customer's highest usage regardless of 12 whether it occurs during the system peak.¹⁷ Modern metering infrastructure, such as 13 AMI, enables utilities to more accurately assign the cost of energy production and 14 distribution to customers on an individual basis (e.g., through TOU rates). Demand 15 charges are a much less sophisticated approach - "second best" if you will - to utility 16 cost recovery overall. 17 18

19

Furthermore, the demand charge in this case is assessed over a fourteen-hour period. This is too long. Many rate design experts suggest that a three-hour demand

¹⁵ Southern Environmental Law Center, <u>A Troubling Trend in Rate Design: Proposed Rate Design Alternatives to</u> <u>Troubling Fixed Charges</u>, December 2015, *available at:*<u>https://www.southernenvironment.org/uploads/news-feed/A_Troubling_Trend_in_Rate_Design.pdf</u>

¹⁶ Regulatory Assistance Project, "<u>Demand Charges: Pathway or Detour?</u>" webinar, December 10 2015, *available at* <u>https://www.raponline.org/event/demand-charges-pathway-or-detour-webinar/</u>

¹⁷ Lazar, J. (2016) "Use great caution in design of residential demand charge rates". Regulatory Assistance Project.

billing period is the optimal length of time over which a demand charge may be incurred.
 Beyond that, it may simply be too difficult for customers to meaningfully shift behavior
 to accommodate the system peak.¹⁸

4 Consider the following scenario: a family of four has a typical, 8am-5pm school and work schedule and likely gone from the home before and after that time period due to 5 6 travel. After a long day working and attending to daily needs, the family is in bed by 7 10pm, only to start all over again around 6am the next day. With such a schedule, it is unlikely laundry, dishes, or other highly consumptive electric appliances can be deployed 8 9 in such a way that demand charges would be minimized. The only times that customers may have to do these chores may be as they are preparing to leave the house in the 10 morning or as they are ending their days and preparing for the next. Thus, it is unlikely 11 customer behavior could be meaningfully shifted in this scenario. For customers who 12 have less traditional schedules, such as many service and healthcare workers, or those 13 14 without children in school, behavior shifts that accommodate this fourteen-hour demand charge period may be possible. Regardless, these demand charges lead to detrimental 15 customer impacts that are highly likely to accrue over such a long time period.¹⁹ 16 In contrast, TOU pricing periods tend to be shorter. In this case, it is only four 17

- 18 hours. The TOU rate proposed within the R-TOUUS tariff serves within the energy-
- 19 related category of customer charges. This energy charge will vary seasonally, like the
- 20 demand charge. However, the peak pricing period is significantly shorter. During the four

 ¹⁸ Regulatory Assistance Project, <u>Smart Rate Design for a Smart Future</u>, July 2015, p. 15, *available at* <u>http://www.raponline.org/wp-content/.../rap-lazar-gonzalez-smart-rate-design-july2015.pdf</u>
 ¹⁹ Vote Solar, "Guidance for utility commissions on Time of Use rates: A shared perspective from consumer and clean energy advocates", Electricity Rate Design Review Paper No.2, July 15, 2017, *available at*

https://votesolar.org/files/9515/0039/8998/TOU-Paper-7.17.17.pdf. See pp. 9-14.

summer months (June - September) and eight winter months (October - May), an energy
 charge will be applied to on-peak and off-peak hours. These pricing periods will also
 vary seasonally (3pm - 7pm in summer; 6am - 8 am & 6pm - 8pm in winter), but the peak
 charge (per kWh) will never be assessed for more than four hours in a day.

A recent review of dynamic pricing models - that include demand charge rates -5 6 found that "prices alone do not necessarily create the conditions needed to achieve 7 effective peak demand management that could be reliably deployed to reduce the need to build more generation and transmission infrastructure." ²⁰ Additionally, the authors 8 9 recommend "the range of signals for residential demand response leave customers with room to act on voluntary bases, based on their capacity to respond." The substantially 10 shorter duration of the peak period will enable customers to respond to the TOU proposed 11 by R-TOUUS. If we return to the previous example regarding an "average" customer's 12 day, it's clear a family could meaningfully shift their behavior to take advantage of the 13 14 lower off-peak rate without drastically altering its schedule to shift energy usage that intrudes on sleeping hours as response to the demand charge could require. 15

Finally, the Company argues smart appliances will assist the customer in shifting behavior as a cost-saving response to the demand charge. Additionally, a variety of information and control technologies provided by AMI can enable customers to automate their residential energy usage through use of in-home displays, web portals, and text or email messaging that provide energy use data to guide customers toward beneficial

²⁰ Gyamfi, S., Krumdieck, S., & Urmee, T. (2013). Residential peak electricity demand response—Highlights of some behavioural issues. *Renewable and Sustainable Energy Reviews*, 25, 71-77, p.76.

1	actions that reduce energy bills. ²¹ While it is true that technological innovations make it
2	possible for customers to respond to electric prices in real time and facilitate customer
3	control over when and how appliances operate, it is not possible to equitably and feasibly
4	implement a demand charge that relies so heavily on customer engagement. First,
5	upgrading appliances to their "smarter" versions may be prohibitively expensive for
6	many customers, including already-struggling low-moderate income or energy-burdened
7	households. For example, a Samsung three-door "non-smart" refrigerator costs roughly
8	\$1,199 while the cost of its "smart" counterpart is nearly doubled in price, at \$2,299. ²²
9	Additionally, the average kitchen remodel costs \$150/square foot, but a remodel that
10	includes modernized appliances could cost up to \$250/square foot. ²³ If these costs are
11	burdensome to homeowners, they may be even more so for landlords, who are not bound
12	by policy incentives to upgrade appliances to "smarter" or more energy efficient versions
13	that would facilitate a renter's response to price signals that rely upon "smart" appliances.
14	Furthermore, the average utility customer is unlikely to actively participate in
15	monitoring their energy usage on a daily basis, as such intensive involvement is
16	unfeasible for modern working families. Additionally, the Company is only at the initial
17	stage of its campaign to implement widespread AMI. Thus, it is unproductive for the
18	Company to head down this path of rate design in testing out a demand charge when such
19	a fee is so crucially dependent upon every home being a "smart" home, with every
20	customer having access to the benefits of AMI.

1	I would caution against a pilot so reliant on advanced technology being used later
2	on to make generalizations for the larger population. A U.S. Department of Energy
3	review of an opt-in dynamic pricing pilot in Sacramento, CA, found that such customers
4	(i.e., those choosing to participate in a pilot) perform better than the average customer,
5	which renders the generalizability of such a pilot to the broader customer base
6	unreliable. ²⁴ In addition to this finding, the Company's customers who are eligible and
7	choose to opt-in to R-TOUUS will already be differentiated from other customers.
8	Participants in the study will be cherry-picked to ensure that they can even enable the
9	implementation of time-varying charges, including the demand charge. This is because
10	only those customers who have been fitted with AMI, or who will be fitted with AMI by
11	the start of the program, will be able to participate in R-TOUUS. Finally, significant
12	differences exist between those who choose to opt-in to a rate program (such as R-
13	TOUUS) and those who are defaulted onto that rate. Those who choose to opt-in (as will
14	participants in the R-TOUUS pilot) are more likely to actively manage their energy usage
15	while those who are defaulted onto a rate are more likely to be passive users. ²⁵
16	By making eligible only customers who already have AMI and by prohibiting
17	customers who utilize residential net metering from participating in the pilot, the
18	Company almost guarantees that its R-TOUUS tariff will successfully deliver benefits to
19	customer-related, energy-related, and demand-related cost recovery. ²⁶ R-TOUUS

 ²⁶ Net metering customers are disproportionately impacted by demand charges requisite to the reduced demand placed by them on the system. See Vote Solar Electricity Rate Design Review Paper No. 1, "Charge without a Cause?" *available at* <u>https://votesolar.org/files/6414/6888/3283/Charge-Without-CauseFinal_71816.pdf</u> or Regulatory Assistance Project, "Demand Charges: Pathway or Detour?" webinar, December 10 2015, *available at* <u>https://www.raponline.org/event/demand-charges-pathway-or-detour-webinar/</u>

excludes those customer segments that would be most negatively impacted by demand
charges, making this a flawed pilot with significant bias. The Company will then likely
apply this tariff model more broadly, and the underlying demand charge will impose a
substantial burden on all but the "perfect" customer, such as those who will participate in
this demand charge pilot.

V. Recommendation and Response to Ameren

8

7

Q. What policies would need to be in place before any kind of demand charge should even be considered?

A substantial list of policies would need to be developed before a default demand 9 charge should be implemented, if at all. These policy changes could include: utility 10 revenue regulation that addresses misalignment between energy-costs, customer-costs, 11 12 and distribution-costs; updated state building codes that reflect energy conservation goals so that less-efficient rentals and low-income households are not punished by burdensome 13 energy usage over which they have little control; and federally-implemented appliance 14 15 standards that require control technologies to enable customer response to time-varying price signals, such as TOU rates that include reasonable peak pricing periods similar to 16 what the Company has proposed in its R-TOU tariff. 17 Since none of these policies are being proposed by the Company, and in some 18 cases are far outside the purview and jurisdiction of the PSC, the demand charge proposal 19 should not be considered as proposed under the R-TOUUS tariff. 20

21 Q. What is your recommendation to Ameren?

1		Numerous policy shortcomings associated with demand charges have been identified
2		here, and are pertinent to R-TOUUS. Renew Missouri believes the Company should be
3		taking steps to pursue rate design modernization through TOU rates but should not
4		pursue a residential demand charge pilot.
5	Q.	Does this conclude your testimony?
6	A.	Yes.
