# Volume 2: Commercial and Industrial Measures

# 2.1 Appliances

# 2.1.1 Clothes Washer

## DESCRIPTION

This measure relates to the installation of a commercial-grade clothes washer meeting the ENERGY STAR<sup>®</sup> minimum qualifications. Note it is assumed the domestic hot water (DHW) and dryer fuels of the installations are known.

This measure was developed to be applicable to the following program types: TOS and NC.

If applied to other program types, the measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT**

The commercial-grade clothes washer must meet the ENERGY STAR<sup>®</sup> minimum qualifications (provided in the table below), as required by the program. The current specification is effective as of February 5, 2018.

## **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is a commercial-grade clothes washer meeting the minimum federal baseline as of January 2013<sup>1</sup>.

Effi	ciency Level	Top loading	Front Loading
Baseline	Federal Standard	≥1.6 MEF, ≤8.5 WF	≥2.00 MEF, ≤5.5 WF
Efficient	ENERGY STAR®	N/A	≥2.2 MEF, ≤4.0 IWF

The Modified Energy Factor (MEF) includes unit operation, water heating, and drying energy use, with the higher the value the more efficient the unit; "The quotient of the capacity of the clothes container, divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load."

The Water Factor (WF) indicates the total water consumption of the unit, with the lower the value the less water required; "*The quotient of the total weighted per-cycle water consumption for cold wash, divided by the capacity of the clothes washer*."<sup>2</sup>

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 11 years.<sup>3</sup>

<sup>&</sup>lt;sup>1</sup> See federal standard 10 CFR 431.152.

<sup>&</sup>lt;sup>2</sup> Definitions provided on the Energy Star<sup>®</sup> website.

<sup>&</sup>lt;sup>3</sup> Appliance Magazine, September 2007 as referenced in ENERGY STAR<sup>®</sup> Commercial Clothes Washer Calculator.

#### **DEEMED MEASURE COST**

The incremental cost is assumed to be  $$200^4$ 

#### LOADSHAPE

Loadshape - Miscellaneous BUS

#### Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = [(Capacity* \frac{1}{MEFbase} *Ncycles) * (%CWbase + (%DHWbase * %ElectricDHW) + (%Dryerbase * %ElectricDryer))]-[(Capacity* \frac{1}{MEFeff} *Ncycles) * (%CWeff + (%DHWeff * %ElectricDHW) + (%Dryereff * %ElectricDryer))]$ 

#### Where:

Capacity = Clothes washer capacity (cubic feet)

= Actual - If capacity is unknown, assume 3.1 cubic feet<sup>5</sup>

MEFbase = Modified Energy Factor of baseline unit

	MEFbase			
Efficiency Level	Top loading	Front	Weighted	
	T op toaunig	Loading	Average <sup>6</sup>	
Federal Standard	1.6	2.0	1.7	

MEFeff

= Modified Energy Factor of efficient unit

= Actual. If unknown, assume average values provided below.

	MEFeff			
Efficiency Level	Top loading	Front Loading	Weighted Average	
ENERGY STAR®	N/A	2.2		

<sup>4</sup>Based on Industry Data 2007 as referenced in ENERGY STAR<sup>®</sup> Commercial Clothes Washer Calculator.

<sup>6</sup> Weighted average MEF of federal standard rating for front- loading and top- loading units. Baseline weighting is based upon the relative top front loading percentage of available non-ENERGY STAR<sup>®</sup> commercial products in the CEC database (accessed 11/26/2015) and ENERGY STAR<sup>®</sup> weighting is based on eligible products as of 11/26/2015. The relative weightings are as follows, see more information in "Commercial Clothes Washer Analysis.xlsx":

Efficiency Level	Front	Тор
Baseline	37%	63%
ENERGY STAR®	99%	1%

<sup>&</sup>lt;sup>5</sup> Based on the average clothes washer volume of all units that pass the federal standard on the California Energy Commission (CEC) database of commercial clothes washer products (accessed on 11/26/2015).

Ncycles	= Number of Cycles per year
	$=2190^{7}$
%CW	<ul> <li>Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below)</li> </ul>
%DHW	= Percentage of total energy consumption used for water heating (different for baseline and efficient unit – see table below)

%Dryer = Percentage of total energy consumption for dryer operation (different for baseline and efficient unit – see table below)

	Percentage of Total Energy Consumption <sup>8</sup>			
	%CW	%DHW	%Dryer	
Federal Standard	6.5%	25.9%	67.6%	
ENERGY STAR	3.5%	14.1%	82.4%	

%Electric<sub>DHW</sub> = Percentage of DHW savings assumed to be electric

DHW fuel	%Electric <sub>DHW</sub>	
Electric	100%	
Natural Gas	0%	

%Electric<sub>Dryer</sub> = Percentage of dryer savings assumed to be electric

Dryer fuel	%Electric <sub>Dryer</sub>
Electric	100%
Natural Gas	0%

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below<sup>9</sup>

	ΔkWH			
Efficiency Level	<b>Electric DHW</b>	Gas DHW	<b>Electric DHW</b>	Gas DHW
Efficiency Level	<b>Electric Dryer</b>	<b>Electric Dryer</b>	Gas Dryer	Gas Dryer
ENERGY STAR <sup>®</sup>	808.2	229.3	725.3	146.5

<sup>&</sup>lt;sup>7</sup> Based on DOE Technical Support Document, 2009; Chapter 8 Life-Cycle Cost and Payback Period Analysis, p 8-15.

<sup>&</sup>lt;sup>8</sup> The percentage of total energy consumption that is used for the machine, heating the hot water, or by the dryer is different depending on the efficiency of the unit. Values are based on a data provided in the ENERGY STAR<sup>®</sup> Calculator for Commercial Clothes Washers.

<sup>&</sup>lt;sup>9</sup> Note that the baseline savings is based on the weighted average baseline MEF (as opposed to assuming front baseline for frontefficient unit and top baseline for top- efficient unit). The reasoning is that the support of the program of more efficient units (which are predominately front loading) will result in some participants switching from planned purchase of a top loader to a front loader.

## SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$  Where:  $\Delta kWh =$  Energy Savings as calculated above

CF = Summer peak coincidence demand (kW) to annual energy (kWh)

factor  $= 0.0001379439^{10}$ 

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below:

	$\Delta kW$			
Efficiency Level	<b>Electric DHW</b>	Gas DHW	<b>Electric DHW</b>	Gas DHW
Efficiency Level	<b>Electric Dryer</b>	<b>Electric Dryer</b>	Gas Dryer	Gas Dryer
ENERGY STAR	0.1115	0.0316	0.1001	0.0202

#### NATURAL GAS SAVINGS

$$\begin{split} \Delta Therms &= [[(Capacity*\frac{1}{MEFbase}*Ncycles)*((\%DHWbase*\%Natural GasDHW*R_eff) + (\%Dryerbase*\%GasDryer\%Gas\_Dryer))] - [(Capacity*\frac{1}{MEFeff}*Ncycles)*((\%DHWeff*\%GasDHW\%NaturalGas\_DHW*R_eff) + (\%Dryereff*\%GasDryer\%Gas\_Dryer))]]*Therm\_convert \end{split}$$

#### Where:

%Gas<sub>DHW</sub>

= Percentage of DHW savings assumed to be Natural Gas

DHW fuel	%Gas <sub>DHW</sub>
Electric	0%
Natural Gas	100%

R\_eff

= Recovery efficiency factor

 $= 1.26^{11}$ 

%Gas<sub>Dryer</sub> = Percentage of dryer savings assumed to be Natural Gas

Dryer fuel	%Gas <sub>Dryer</sub>
Electric	0%
Natural Gas	100%

Therm\_convert = Conversion factor from kWh to Therm = 0.03412

Other factors as defined above.

<sup>11</sup> To account for the different efficiency of electric and natural gas hot water heaters (gas water heater: recovery efficiencies ranging from 0.74 to 0.85 (0.78 used), and electric water heater with 0.98 recovery efficiency

<sup>&</sup>lt;sup>10</sup> Based on Ameren Missouri 2016 Loadshape for Business Miscellaneous End-Use. Upon inspection and comparison to the residential clothes washer coincidence factor, this is a reasonable assumption until data becomes available to inform a technology specific coincidence factor. Given that business laundry schedules are likely more variable compared to residential, it follows that less overlap with the system peak hour is possible.

<sup>(</sup>http://www.energystar.gov/ia/partners/bldrs\_lenders\_raters/downloads/Waste\_Water\_Heat\_Recovery\_Guidelines.pdf). Therefore a factor of 0.98/0.78 (1.26) is applied.

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below:

	ΔTherms			
Efficiency I evol	<b>Electric DHW</b>	Gas DHW	<b>Electric DHW</b>	Gas DHW
Efficiency Level	<b>Electric Dryer</b>	<b>Electric Dryer</b>	Gas Dryer	Gas Dryer
ENERGY STAR	0.0	24.9	2.8	27.7

WATER IMPACT DESCRIPTIONS AND CALCULATION

$$\Delta Water(gallons) = Capacity * (IWFbase - IWFeff) * Ncycles$$

Where:

WFbase = Water Factor of baseline clothes washer

	WFbase		
Efficiency Level	Top loading	Front	Weighted
	Top loading	Loading	Average <sup>12</sup>
Federal Standard	8.5	5.5	7.4

WFeff = Water Factor of efficient clothes washer

= Actual - If unknown assume average values provided below

Using the default assumptions provided above, the prescriptive water savings for each efficiency level are presented below:

		WF		∆Water (gallons per year)
Efficiency Level	Top Loaders	Front Loaders	Weighted Average	Weighted Average
Federal Standard	8.5	5.5	7.4	n/a
ENERGY STAR		4.5		19,874

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

<sup>&</sup>lt;sup>12</sup> Weighted average MEF of federal standard rating for frontloading and top-loading units. Baseline weighting is based upon the relative top v front loading percentage of available non-ENERGY STAR® commercial product in the CEC database (accessed 11/26/2015) and ENERGY STAR<sup>®</sup> weighting is based on eligible products as of 11/26/2015. The relative weightings are as follows, see more information in "Commercial Clothes Washer Analysis.xlsx":

Efficiency Level	Front	Тор
Baseline	37%	63%
ENERGY STAR®	99%	1%

# 2.1.2 Clothes Dryer

#### DESCRIPTION

This measure is for the installation of a residential clothes dryer, utilized in a commercial setting, meeting the ENERGY STAR<sup>®</sup> criteria. ENERGY STAR<sup>®</sup> qualified clothes dryers save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions (such as air flow and/or heat input rate) improving air circulation through better drum design or booster fans, and improving efficiency of motors. Reducing the runtime of dryers through automatic termination by temperature and moisture sensors is believed to have the greatest potential for reducing energy use in clothes dryers.<sup>13</sup> ENERGY STAR<sup>®</sup> provides criteria for both gas and electric clothes dryers.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

Clothes dryer must meet the ENERGY STAR<sup>®</sup> criteria, as required by the program.

#### **Definition of Baseline Equipment**

The baseline condition is a clothes dryer meeting the minimum federal requirements for units manufactured on or after January 1, 2015.

#### **Deemed Lifetime of Efficient Equipment**

The expected measure life is assumed to be 14 years.<sup>14</sup>

#### **Deemed Measure Cost**

Dryer Size	Incremental Cost <sup>15</sup>
Standard	\$75
Compact	\$105

#### LOADSHAPE

## Algorithm

## **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = (Load/CEFbase - Load/CEFeff) * Ncycles * \% Electric$ 

Where:

Load

= The average total weight (lbs) of clothes per drying cycle. If dryer size is unknown, assume standard.

Dryer Size	Load (lbs) <sup>16</sup>
Standard	8.45
Compact	3

CEFbase = Combined energy factor (CEF) (lbs/kWh) of the baseline unit is based on existingfederal standards energy factor and adjusted to CEF as performed in the ENERGY STAR<sup>®</sup> analysis. <sup>17</sup> If product class unknown, assume electric, standard.

Product Class	CEFbase (lbs/kWh)
Vented Electric, Standard ( $\geq 4.4 \text{ ft}^3$ )	3.11
Vented Electric, Compact (120V) (< 4.4 ft <sup>3</sup> )	3.01
Vented Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	2.73
Ventless Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	2.13
Vented Gas	$2.84^{18}$

CEFeff = CEF (lbs/kWh) of the ENERGY STAR<sup>®</sup> unit based on ENERGY STAR<sup>®</sup> requirements.<sup>19</sup> If product class unknown, assume electric, standard,

requirements. In product cluss unknown, ussui	ie electric, standar
Product Class	CEFeff
Vented or Ventless Electric, Standard ( $\geq$ 4.4 ft <sup>3</sup> )	3.93
Vented or Ventless Electric, Compact (120V) (<4.4 ft <sup>3</sup> )	3.80
ftVented Electric, Compact (240V) (< 4.4 ft <sup>3</sup> )	3.45
Ventless Electric, Compact (240V) (< 4.4 ft <sup>3</sup> )	2.68
Vented Gas	$3.48^{20}$

<sup>&</sup>lt;sup>16</sup> Based on ENERGY STAR<sup>®</sup> test procedures. <u>https://www.energystar.gov/index.cfm?c=clothesdry.pr\_crit\_clothes\_dryers</u>

<sup>&</sup>lt;sup>17</sup> ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis

<sup>&</sup>lt;sup>18</sup> Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

<sup>&</sup>lt;sup>19</sup> ENERGY STAR<sup>®</sup> Clothes Dryers Key Product Criteria.

https://www.energystar.gov/index.cfm?c=clothesdry.pr\_crit\_clothes\_dryers 20 Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

Ncycles = Number of dryer cycles per year. Use actual data if available. If unknown, refer to the table below.<sup>21</sup>

Application	Cycles per Year
Multi-family	1,074
Laundromat	1,483
On-Premise	3,607
Laundromat	

%Electric = The percent of overall savings coming from electricity

= 100% for electric dryers, 5% for gas dryers<sup>22</sup>

Using defaults provided above:

	kWh		
Product Class	Multifamily	Laundromat	On-Premise Laundromat
Vented Electric, Standard ( $\geq$ 4.4 ft <sup>3</sup> )	608.9	840.7	2044.9
Vented Electric, Compact (120V) (< 4.4 ft <sup>3</sup> )	222.5	307.3	747.4
Vented Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	246.3	340.1	827.2
Ventless Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	310.4	428.7	1042.6
Vented Gas	29.4	40.6	98.7

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = h * CF$  Where:

 $\Delta kWh$  = Energy savings as calculated above

= Summer peak coincidence demand (kW) to annual energy (kWh) factor =  $0.0001379439^{23}$ 

Using defaults provided above:

CF

	kW		
Product Class	Multifamily	Laundromat	<b>On-Premise</b>
			Laundromat
Vented Electric, Standard ( $\geq$ 4.4 ft <sup>3</sup> )	0.0840	0.1160	0.2821

<sup>&</sup>lt;sup>21</sup> NOPR analysis for DOE Commercial Clothes Washer standard. Annual use cycles of 1,074 and 1,483 for multifamily and laundromat applications, respectively. <u>https://www.regulations.gov/document?D=EERE-2012-BT-STD-0020-0021</u>. On-premise laundromat cycle average value for dryer cycles in healthcare facility, hotels, drycleaners and laundromats from tests conducted in Nicor Gas Emerging Technology Program's Commercial Dryer Modulation Retrofit Public Project Report.

<sup>&</sup>lt;sup>22</sup> %Electric accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). 5% was determined using a ratio of the electric to total savings from gas dryers given by ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis. Value reported in 2015 EPA EnergySTAR<sup>®</sup> appliance calculator.

<sup>&</sup>lt;sup>23</sup> Based on Ameren Missouri 2016 Loadshape for Business Miscellaneous End-Use. Upon inspection and comparison to the Residential clothes washer coincidence factor, this is a reasonable assumption until data becomes available to inform a technology specific coincidence factor. Given that business laundry schedules are likely more variable compared to residential, it follows that less overlap with the system peak hour is possible.

	kW		
Product Class	Multifamily	Laundromat	On-Premise Laundromat
Vented Electric, Compact (120V) (< 4.4 ft <sup>3</sup> )	0.0307	0.0424	0.1031
Vented Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	0.0340	0.0469	0.1141
Ventless Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	0.0428	0.0591	0.1438
Vented Gas	0.0041	0.0056	0.0136

## NATURAL GAS ENERGY SAVINGS

Natural gas savings only apply to ENERGY STAR<sup>®</sup> vented gas clothes dryers.

$$\Delta Therm = \left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff}\right) * Ncycles * Therm\_convert * %Gas$$

Where:

Therm\_convert = Conversion factor from kWh to Therm

= 0.03413

%Gas = Percent of overall savings coming from gas

= 0% for electric units and 84% for gas units  $^{24}$ 

Using defaults provided above:

∆Therms

= (8.45/2.84 - 8.45/3.48) \* Ncycles \* 0.03413 \* 0.84

		ΔTherms	
Product Class	Multi-family	Laundromat	<b>On-Premise</b>
	Iviuiu-iaiiiiy	Launuronnat	Laundromat
Vented Gas	16.8	23.3	56.6

#### PEAK GAS SAVINGS

Savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

Where:

 $\Delta$ Therms = Therm impact calculated above 365.25 = Days per year

<sup>&</sup>lt;sup>24</sup> % Gas accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). 84% was determined using a ratio of the gas to total savings from gas dryers given by ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis.

# Ameren Missouri

Using defaults provided above:

	ΔPeakTherms		
Product Class	Multi-family	Laundromat	On-Premise Laundromat

# 2.2 Compressed Air

## 2.2.1 Compressed Air No Loss Condensate Drain

## DESCRIPTION

No-loss condensate drains remove condensate as needed without venting compressed air, resulting in less air demand and better efficiency. Replacement or upgrades of existing no-loss drains are not eligible for this measure.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is a no-loss condensate drain.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a standard condensate drain (open valve, timer, or both).

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of a no-loss condensate drain is assumed to be 13 years.<sup>25</sup>

#### **DEEMED MEASURE COST**

The measure cost is \$700 per drain. <sup>26</sup>

#### LOADSHAPE

Air Comp BUS

#### Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

$$\Delta kWh = CFM$$
reduced \*  $kWCFM$  \* Hours

Where:

$CFM_{reduced}$	= Reduced air consumption (CFM) per drain	
	$= 3 \text{ CFM}^{27}$	
kWcfm	= System power demand reduction per reduced air consumption (kw/CFM), depending on the type of compressor control, see table below <sup>28</sup>	

<sup>&</sup>lt;sup>25</sup> "Measure Life Study," Energy & Resource Solutions (prepared for the Massachusetts Joint Utilities): Table 1-1, 2005.

<sup>&</sup>lt;sup>26</sup> Based on empirical project data from ComEd Comprehensive Compressed Air Study program and VEIC review of pricing data found in CAS Cost Data.xls.

<sup>&</sup>lt;sup>27</sup> Reduced CFM consumption is based on a timer drain opening for 10 seconds every 300 seconds as the baseline. See "Industrial System Standard Deemed Saving Analysis.xls."

<sup>&</sup>lt;sup>28</sup> Calculated based on the type of compressor control. This assumes the compressor will be between 40% and 100% capacity before and after the changes to the system demand. See "Industrial System Standard Deemed Saving Analysis.xls."

Compressor Control Type	kW <sub>CFM</sub>
Reciprocating - On/off Control	0.184
Reciprocating - Load/Unload	0.136
Screw - Load/Unload	0.152
Screw - Inlet Modulation	0.055
Screw - Inlet Modulation w/ Unloading	0.055
Screw - Variable Displacement	0.153
Screw - VFD	0.178

#### Hours = Compressed air system pressurized hours

= Use actual hours if known, otherwise assume values in table below:

Shift	Hours
Single shift	1976 hours
(8/5)	7 AM – 3 PM, weekdays, minus some
(8/3)	holidays and scheduled down time
	3952 hours
2-shift (16/5)	7AM – 11 PM, weekdays, minus some
	holidays and scheduled down time
	5928 hours
3-shift (24/5)	24 hours per day, weekdays, minus some
	holidays and scheduled down time
	8320 hours
4-shift (24/7)	24 hours per day, 7 days a week minus some
	holidays and scheduled down time

## SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * CF$$

Where:

= Electric energy savings, calculated above

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor

=

 $= 0.0001379439^{29}$ 

**MEASURE CODE:** 

ΔkWh

<sup>&</sup>lt;sup>29</sup> 2016 Ameren Missouri Coincident Peak Demand Factor for Commercial Compressed Air. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

# 2.2.2 Compressed Air Nozzle

#### DESCRIPTION

This measure applies to the replacement of a standard air nozzle with high-efficiency air nozzle used in a compressed air system. High-efficiency air nozzles use the Coandă effect to pull in free air and use significantly less compressed air for blowing off parts or for drying. These nozzles have the added benefits of noise reduction and improved safety in systems with greater than 30 psig.

This measure was developed to be applicable to the following program types: DI and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is a compressed air nozzle meeting program requirements.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a standard air nozzle.

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The measure life is 15 years.<sup>30</sup>

#### **DEEMED MEASURE COST**

Incremental measure costs are presented in the following table.<sup>31</sup>

Nozzle Diameter	Measure Cost
1/8"	\$42
1/4"	\$57
5/16"	\$87
1/2"	\$121

#### LOADSHAPE

Air Comp BUS

#### Algorithm

#### CALCULATION OF ENERGY SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = (SCFM * SCFM\%Reduced) * kW/CFM * \%Use * Hours Where:$ 

SCFM = Air flow through standard nozzle.

<sup>&</sup>lt;sup>30</sup> "Focus on Energy Evaluation - Business Programs: Measure Life Study," prepared for State of Wisconsin Public Service Commission by PA Consulting Group, August 25, 2009.

<sup>&</sup>lt;sup>31</sup> Costs are from EXAIR's website and are an average of nozzles that meet the flow requirements. Models include Atto Super, Pico Super, Nano Super, Micro Super, Mini Super, Super and Large Super nozzles. www.exair.com. Accessed March 20, 2014.

<b>Orifice Diameter</b>	SCFM
1/8"	21
1/4"	58
5/16"	113
1/2"	280

= Actual rated flow at 80 psi, if known. If unknown, use CFM by orifice diameter from table below.<sup>32, 33</sup>

SCFM%Reduced = Percent reduction in air loss per nozzle.

= Estimated at  $50\%^{34}$ 

kW/CFM = System power reduction per air demand (kW/CFM), depending on the type of air compressor; see table below<sup>35</sup>

Air Compressor Type	ΔkW/CF
Reciprocating – On/off Control	0.18
Reciprocating – Load/Unload	0.14
Screw – Load/Unload	0.15
Screw – Inlet Modulation	0.06
Screw – Inlet Modulation w/	0.06
UnloadingScrew – Variable Displacement	0.15
Screw - VFD	0.18

- %USE = Percent of the compressor total operating nours that the nozzle is in use
  - = Custom, or if unknown, assume  $5\%^{36}$
- Hours = Compressed air system pressurized hours
  - = Use actual hours if known, otherwise assume values in table below:

<sup>&</sup>lt;sup>32</sup> Review of manufacturer's information

<sup>&</sup>lt;sup>33</sup> Technical Reference Manual (TRM) for Ohio Senate Bill 221,"Energy Efficiency and Conservation Program" and 09-512-GEUNC, October 15, 2009, Pgs 170-171.

<sup>&</sup>lt;sup>34</sup> Conservative estimate based on average values provided by the Compressed Air Challenge Training Program, Machinery's Handbook 25<sup>th</sup> Edition, and manufacturers' catalog.

<sup>&</sup>lt;sup>35</sup> Calculated based on the type of compressor control. This assumes the compressor will be between 40% and 100% capacity before and after the changes to the system demand. See "Industrial System Standard Deemed Saving Analysis.xls."

<sup>&</sup>lt;sup>36</sup> Assumes 50% handheld air guns and 50% stationary air nozzles. Manual air guns tend to be used less than stationary air nozzles, and a conservative estimate of 1 second of blow-off per minute of compressor run time is assumed. Stationary air nozzles are commonly more wasteful as they are often mounted on machine tools and can be manually operated resulting in the possibility of a long term open blow situation. An assumption of 5 seconds of blow-off per minute of compressor run time is used.

# 2.2.3 VSD Air Compressor

## DESCRIPTION

This measure relates to the installation of an air compressor with a variable frequency drive, load/no load controls, or variable displacement control. A baseline modulating compressor regulates output by choking off the inlet air, which is not efficient. Efficient compressors use a variable speed drive on the motor to match output to the load. Savings are calculated using representative baseline and efficient demand numbers for compressor capacities according to the facility's load shape, and the number of hours the compressor runs at that capacity. Demand curves are as per US Department of Energy (DOE) data for a Variable Speed compressor versus a Modulating compressor. This measure applies only to an individual compressor  $\leq 40$  hp.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The high efficiency equipment is a compressor 5-40 hp with variable speed control.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a modulating compressor with blow down 5-40 hp

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

10 years.38

#### **DEEMED MEASURE COST**<sup>39</sup>

Incremental Cost (\$) =  $(127 \text{ x hp}_{compressor}) + 1446$  Where:

hp<sub>compressor</sub> = compressor motor nominal horsepower

# 2.3 Food Service

# 2.3.1 Combination Oven

## DESCRIPTION

This measure applies to full or half-sized electric ENERGY STAR<sup>®</sup> combination ovens with a pan capacity  $\geq 5$  and  $\leq 20$  and to full or half-sized natural gas fired ENERGY STAR<sup>®</sup> combination ovens with a pan capacity  $\geq 6$  installed in a commercial kitchen. Combination ovens combine the function of hot air convection (convection mode), saturated and superheated steam heating (steam mode), and combination convection/steam mode for moist heating, to perform steaming, baking, roasting, re-thermalizing, and proofing of various food products. ENERGY STAR<sup>®</sup> certified combination ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be an ENERGY STAR<sup>®</sup> certified combination oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type, operation mode (steam or convection), and pan capacity.

## **ENERGY STAR<sup>®</sup> Requirements (Version 2.2, Effective October 7, 2015)**

Fuel Type	Operation	Idle Rate (Btu/hr for Gas, kW for Electric)	Cooking-Energy Efficiency (%)
Natural Gas	Steam Mode	$\leq$ 200P+6,511	≥ 41
	Convection Mode	$\leq$ 150P+5,425	≥ 56
Ele stri s	Steam Mode	$\leq 0.133P+0.6400$	≥ 55
Electric	Convection Mode	$\leq$ 0.080P+0.4989	$\geq 76$

Note: P = Pan capacity as defined in Section 1.T of the Commercial Ovens Program Requirements Version 2.2.<sup>44</sup>

## **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new electric or natural gas combination oven that is not ENERGY STAR<sup>®</sup> certified.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>45</sup>

## **DEEMED MEASURE COST**

The incremental capital cost for this measure is \$4,300.<sup>46</sup>

<sup>&</sup>lt;sup>44</sup> Pan capacity is defined as the number of steam table pans the combination oven is able to accommodate as per the ASTM F1495-05 standard specification.

## 2.3.2 Commercial Steam Cooker

#### DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR<sup>®</sup> steam cookers installed in a commercial kitchen. Commercial steam cookers contain compartments where steam energy is transferred to food by direct contact. ENERGY STAR<sup>®</sup> certified steam cookers have shorter cook times, higher production rates, and reduced heat loss due to better insulation and more efficient steam delivery.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be an ENERGY STAR<sup>®</sup> certified steam cooker meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type and pan capacity.

	Electric Efficien	Electric Efficiency Requirements		Natural Gas Efficiency	
Pan Capacity	Idle Energy Rate		Idle Energy Rate		
	Idle Energy Rate	Efficiency		Efficiency	
3-pan	$\leq$ 400 W		$\leq$ 6,250 Btu/hr	$\geq$ 38%	
4-pan	$\leq$ 530 W	≥ 50%	$\leq$ 8,350 Btu/hr	N/A	
5-pan	$\leq 670 \ \mathrm{W}$	$\geq 30\%$	$\leq$ 10,400 Btu/hr		
6-pan and larger	$\leq 800 \text{ W}$		$\leq$ 12,500 Btu/hr		

#### ENERGY STAR Requirements (Version 1.2, Effective August 1, 2003)

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new electric or natural gas steam cooker that is not ENERGY STAR<sup>®</sup> certified.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>50</sup>

#### DEEMED MEASURE COST

Actual incremental cost for this measure should be used. If actuals are unavailable use \$4,150.51

<sup>&</sup>lt;sup>59</sup> Algorithms and assumptions derived from ENERGY STAR<sup>®</sup> Commercial Kitchen Equipment Savings Calculator.

<sup>&</sup>lt;sup>60</sup> Water use for ENERGY STAR<sup>®</sup> steam cookers is the average of water use values provided by ENERGY STAR<sup>®</sup> for steam generator, boiler-based, and boiler-less cookers.

# 2.3.3 Fryer

## DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR<sup>®</sup> certified fryers installed in a commercial kitchen. ENERGY STAR<sup>®</sup> fryers offer shorter cook times and higher production rates through advanced burner and heat exchanger designs. Fry pot insulation reduces standby losses, resulting in lower idle energy rates. Standard-sized ENERGY STAR<sup>®</sup> fryers are up to 30% more efficient, and large-vat ENERGY STAR<sup>®</sup> fryers are up to 35% more efficient, than standard fryers.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be an ENERGY STAR<sup>®</sup> certified fryer meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and fryer capacity (standard versus large vat).

En en of a state in the state of the state o				
Fryer Capacity	Electric Efficiency Requirements		Natural Gas Efficiency Requirements	
	Idle Energy Rate	Cooking Efficiency Consumption	Idle Energy Rate	Cooking Efficiency Consumption
Standard Open Deep-Fat Fryer	$\leq$ 1,000 W		$\leq$ 9,000 Btu/hr	
Large Vat Open Deep-Fat Fryer	≤ 1,100 W	$\geq 80\%$	≤ 12,000 Btu/hr	≥ 50%

## ENERGY STAR<sup>®</sup> Requirements (Version 2.0, Effective April 22, 2011)

## **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new electric or natural gas fryer that is not ENERGY STAR<sup>®</sup> certified.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>61</sup>

#### DEEMED MEASURE COST

The incremental capital cost for this measure is \$210 for standard electric, \$0 for large vat electric, \$0 for standard gas, and \$1,120 for large vat gas fryers.<sup>62</sup>

#### **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

Custom calculation for an electric fryer below; otherwise use deemed value of 952.3 kWh for standard fryers and 2,537.9 kWh for large vat fryers.<sup>63</sup>

$\Delta kWh = (\Delta IdleEnergy + \Delta CookingEnergy) * Days/1,000$ Where:			
∆IdleEnergy	= (ElecIdleBase* (Hours – FoodCooked/ElecPCBase)) – ElecIdleESTAR		
	* (Hours – FoodCooked/ElecPCESTAR))		
ΔCookingEnergy	= (FoodCooked * $EFOOD_{Elec}$ / $ElecEff_{Base}$ ) – (FoodCooked *		
	EFOOD <sub>Elec</sub> /ElecEffestar)		

#### Where:

ΔIdleEnergy	= Difference in idle energy between baseline and efficient fryer
$\Delta CookingEnergy$	= Difference in cooking energy between baseline and efficient fryer
Days	= Annual days of operation
	= Custom or, if unknown, use 365.25 days per year
1,000	= Wh to kWh conversion factor
ElecIdle <sub>Base</sub>	= Idle energy rate of baseline electric fryer
	= 1,050 W for standard fryers and 1,350 W for large vat fryers
ElecIdle <sub>ESTAR</sub>	= Idle energy rate of ENERGY STAR <sup>®</sup> electric fryer
	= Custom or, if unknown, use 1,000 W for standard fryers and 1,100 for large vat fryers
Hours	= Average daily hours of operation
	= Custom or, if unknown, use 16 hours per day for a standard fryer and 12 hours per day for a large vat fryer
FoodCooked	= Food cooked per day
	= Custom or, if unknown, use 150 pounds
ElecPC <sub>Base</sub>	= Production capacity of baseline electric fryer
	= 65 lb/hr for standard fryers and 100 lb/hr for large vat fryers
ElecPC <sub>ESTAR</sub>	= Production capacity of ENERGY STAR <sup>®</sup> electric fryer
	= Custom or, if unknown, use 70 lb/hr for standard fryers and 110 lb/hr for large vat fryers
EFOOD <sub>Elec</sub>	= ASTM energy to food = 167 Wh/lb

<sup>&</sup>lt;sup>63</sup> Algorithms and assumptions derived from ENERGY STAR<sup>®</sup> Commercial Kitchen Equipment Savings Calculator.

ElecEff <sub>Base</sub>	= Cooking efficiency of baseline electric fryer
	= 75% for standard fryers and 70% for large vat fryers
ElecEff <sub>ESTAR</sub>	= Cooking efficiency of ENERGY STAR <sup>®</sup> electric fryer
	= Custom or, if unknown, use 80% for both standard and large vat fryers

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

	$\Delta k = \Delta kWh * CF$ Where:
$\Delta kWh$	= Electric energy savings, calculated above
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor
	$= 0.0001998949^{64}$
0.1	. 11 1 6 1 1

Other variables as defined above.

#### NATURAL GAS ENERGY SAVINGS

Where:

Custom calculation for a natural gas fryer below; otherwise use deemed value of 507.9 therms/yr for standard fryers and 415.1 therms/yr for large vat fryers.<sup>65</sup>

$\Delta Therms = (\Delta IdleEnergy + \Delta CookingEnergy) * Days/100,000$ Where:				
∆IdleEnergy	= (GasIdle <sub>Base</sub> * (Hours – FoodCooked/GasPC <sub>Base</sub> )) – (GasIdle <sub>ESTAR</sub> *			
	$(Hours - FoodCooked/GasPC_{ESTAR}))$			
ΔCookingEnergy	$= (FoodCooked * EFOOD_{Gas}/ GasEff_{Base}) -$			
	(FoodCooked * EFOOD <sub>Gas</sub> /GasEffestar)			
:				
100,000	= Btu to therms conversion factor			
GasIdle <sub>Base</sub>	= Idle energy rate of baseline gas fryer			
	= 14,000 Btu/hr for standard fryers and 16,000 Btu/hr for large vat fryers			
GasIdle <sub>ESTAR</sub>	= Idle energy rate of ENERGY STAR <sup>®</sup> gas fryer			
	= Custom or, if unknown, use 9,000 Btu/hr for standard fryers and 12,000			
	Btu/hr for large vat fryers			
GasPc <sub>Base</sub>	= Production capacity of baseline gas fryer			
	= 60 lb/hr for standard fryers and 100 lb/hr for large vat fryers			
GasPc <sub>ESTAR</sub>	= Production capacity of ENERGY STAR <sup>®</sup> gas fryer			
	= Custom or, if unknown, use 65 lb/hr for standard fryers and 110 lb/hr for large vat fryers

# 2.3.4 Convection Oven

# DESCRIPTION

This measure applies to either full or half-sized electric ENERGY STAR<sup>®</sup> convection ovens and to half sized natural gas fired ENERGY STAR<sup>®</sup> convection ovens installed in a commercial kitchen. Convection ovens are general purpose ovens that use fans to circulate hot, dry air over the food surface. ENERGY STAR<sup>®</sup> certified convection ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be an ENERGY STAR<sup>®</sup> certified convection oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and oven capacity (full size versus half size).

	Electric Efficier	Electric Efficiency Requirements		Natural Gas Efficiency Requirements		
Oven Capacity	Idle Energy Rate	Cooking	Idle Energy Rate	Cooking Efficiency		
		Efficiency				
Full Size	$\leq 1.60 \text{ kW}$	>71%	$\leq$ 12,000 Btu/hr	$\geq$ 46%		
Half Size	$\leq 1.00 \text{ kW}$	$\geq$ /170	N/A	N/A		

# **ENERGY STAR<sup>®</sup> Requirements (Version 2.2, Effective October 7, 2015)**

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new electric or natural gas convection oven that is not ENERGY STAR<sup>®</sup> certified.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>66</sup>

#### DEEMED MEASURE COST

The incremental capital cost for this measure is \$0.67

# 2.3.6 Kitchen Demand Ventilation Controls

## DESCRIPTION

Installation of commercial kitchen demand ventilation controls that vary the ventilation based on cooking load and/or time of day. This measure applies to the following program types: RF, NC. If applied to other program types, the measure savings should be verified.

#### DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be a control system that varies the exhaust rate of kitchen ventilation (exhaust and/or makeup air fans) based on the energy and effluent output from the cooking appliances (i.e., the more heat and smoke/vapors generated, the more ventilation needed). This involves installing a new temperature sensor in the hood exhaust collar and/or an optic sensor on the end of the hood that sense cooking conditions which allows the system to automatically vary the rate of exhaust to what is needed by adjusting the fan speed accordingly.

#### DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is kitchen ventilation that has constant speed ventilation motor.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT<sup>76</sup>

The expected measure life is assumed to be 15 years.

#### MEASURE COST<sup>77</sup>

Where:

The incremental capital cost for this measure is:

Measure Category	Incremental Cost (\$/HP)
DVC Control Retrofit	\$1,991
DVC Control New	\$1,991

# 2.3.7 Hot Food Holding Cabinet

## DESCRIPTION

This measure applies to electric ENERGY STAR<sup>®</sup> certified hot food holding cabinets (HFHCs) installed in a commercial kitchen. ENERGY STAR<sup>®</sup> HFHCs achieve approximately 70% higher efficiency than standard models by incorporating better insulation which reduces heat loss, offers better temperature uniformity within the cabinet from top to bottom, and keeps the external cabinet cooler. In addition, many certified HFHCs may include additional energy saving devices such as magnetic door gaskets, auto-door closures, or dutch doors.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new ENERGY STAR<sup>®</sup> electric HFHC meeting idle energy rate limits as determined by product interior volume.

#### **ENERGY STAR<sup>®</sup> Requirements (Version 2.0, Effective October 1, 2011)**

Interior Volume (ft <sup>3</sup> )	Idle Energy Consumption Rate (W)
0 < V < 13	≤21.5 V
$13 \le V \le 28$	$\leq$ 2.0 V + 254.0
$28 \le V$	$\leq$ 3.8 V + 203.5

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new electric HFHC that is not ENERGY STAR<sup>®</sup> certified.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>83</sup>

#### **DEEMED MEASURE COST**

Actual incremental costs should be used if available. If actual costs are unknown, assume \$1,783.84

# 2.3.8 Pre-Rinse Spray Valve

#### DESCRIPTION

Pre-rinse valves use a spray of water to remove food waste from dishes prior to cleaning in a dishwasher. More efficient spray valves use less water, thereby reducing water consumption, water heating cost, and waste water (sewer) charges. Pre-rinse spray valves include a nozzle, squeeze lever, and dish guard bumper. The primary impacts of this measure are water savings. Reduced hot water consumption saves either natural gas or electricity, depending on the type of energy the hot water heater uses.

This measure was developed to be applicable to the following program types: TOS, RF, and DI. If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the new or replacement pre-rinse spray nozzle must use less than 1.6 gallons per minute.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment will vary based on the delivery method and is defined below:

Time of Sale	Retrofit, Direct Install
The baseline equipment is assumed	Actual existing flow rates should be used when possible. If unknown, baseline
to be 1.6 gallons per minute. The	can be assumed to be 2.23 gallons per minute. <sup>87</sup> If existing pre-rinse spray valve
Energy Policy Act of 2005 sets the	flow rate is unknown, then existing pre-rinse spray valve must have been
maximum flow rate for pre-rinse	installed prior to 2006. The Energy Policy Act of 2005 sets the maximum flow
spray valves at 1.6 gallons per	rate for pre-rinse spray valves at 1.6 gallons per minute at 60 pounds per square
minute at 60 pounds per square inch	inch of water pressure when tested in accordance with ASTM F2324-03. This
of water pressure when tested in	performance standard went into effect January 1, 2006. However, field data
accordance with ASTM F2324-03.	shows that not all nozzles in use have been replaced with the newer flow rate
This performance standard went	nozzle. Products predating this standard can use up to five gallons per minute.
into effect January 1, 2006.	

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 5 years<sup>88</sup>

#### DEEMED MEASURE COST

When available, the actual cost of the measure should be used. If unknown, a default value of \$92.90<sup>89</sup> may be assumed.

#### LOADSHAPE

Cooking BUS

#### Algorithm

<sup>&</sup>lt;sup>87</sup> Verification measurements taken at 195 installations showed average pre flowrates of 2.23 gallons per minute. IMPACT AND PROCESS EVALUATION FINAL REPORT for CALIFORNIA URBAN WATER CONSERVATION COUNCIL 2004-5 PRERINSE SPRAY VALVE INSTALLATION PROGRAM (PHASE 2) (PG&E Program # 1198-04; SoCalGas Program 1200-04) ("CUWCC Report," Feb 2007).

<sup>&</sup>lt;sup>88</sup> Consistent with Ameren Missouri MEEIA 2016-18 and KCPL TRM assumptions.

<sup>&</sup>lt;sup>89</sup>Average of costs recognized by Ameren Missouri (\$85.8) and KCPL (\$100).

# CALCULATION OF ENERGY SAVINGS

#### ELECTRIC ENERGY SAVINGS (NOTE WATER SAVINGS MUST FIRST BE CALCULATED)

$\Delta kWH = \Delta$	Gallons * 8.33 * 1 * (Tout - Tin) * (1/EFF_Elec) /3,413 Where:
∆Gallons	= amount of water saved as calculated below in Water Impact Calculation
8.33	= specific mass in pounds of one gallon of water (lbm/gal)
1	= Specific heat of water: 1 Btu/lbm/°F
Tout	= Water Heater Outlet Water Temperature
	= Custom, otherwise assume $Tin + 70^{\circ}F$ temperature rise from $Tin^{90}$
Tin	= Inlet Water Temperature
	= Custom, otherwise assume $57.9F^{91}$
EFF_Elec	= Efficiency of electric water heater supplying hot water to pre-rinse spray valve
	=Custom, otherwise assume 97% <sup>92</sup>

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

	$\Delta k = \Delta kWh * CF$ Where:
$\Delta kWh$	= Electric energy savings, calculated above
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor
	$= 0.0001998949^{93}$

#### NATURAL GAS ENERGY SAVINGS

 $\Delta$ Therms =  $\Delta$ Gallons \* 8.33 \* 1 \* (Tout - Tin) \* (1/EFF\_Gas) /100,000 Where

(new variables only):

EFF_Gas	= Efficiency of gas water heater supplying hot water to pre-rinse spray valve =
	Custom, otherwise assume 80% <sup>94</sup>

# WATER IMPACT CALCULATION

<sup>&</sup>lt;sup>90</sup> If unknown, assume a 70 degree temperature rise from Tin per Food Service Technology Center calculator assumptions to account for variations in mixing and water heater efficiencies.

<sup>&</sup>lt;sup>91</sup> Using 40" deep soil temp as a proxy at Powell Gardens SCAN site. Average by month of available data from 3/28/02–10/11/14: 12 month average is 57.898. <u>http://www.wcc.nrcs.usda.gov/nwcc/site?sitenum=2061</u>.

<sup>&</sup>lt;sup>92</sup> This efficiency value is based on IECC 2012/2015 performance requirement for electric resistant water heaters rounded without the slight adjustment allowing for reduction based on size of storage tank.

<sup>&</sup>lt;sup>93</sup> 2016 Ameren Missouri Coincident Peak Demand Factor for Commercial Electric Cooking. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

<sup>&</sup>lt;sup>94</sup> IECC 2012/2015, Table C404.2, Minimum Performance of Water-Heating Equipment.

 $\Delta$ Gallons = (FLObase - FLOeff) \* 60 \* HOURSday \* DAYSyear Where:

FLObase = Base case flow in gallons per minute (Gal/min). Use actual when appropriate if available, otherwise assume:

Time of Sale	Retrofit, Direct Install	
1.6 gal/min <sup>95</sup>	2.23 gal/min <sup>96</sup>	

FLOeff = Efficient case flow in gallons per minute (Gal/min). Use actual flow rate of installed equipment if known, otherwise assume:

Time of Sale	Retrofit, Direct Install	
1.06 gal/min <sup>97</sup>	1.06 gal/min	

60 = Minutes per hour

HOURSday = Hours per day that the pre-rinse spray valve is used at the site, custom, otherwise:<sup>98</sup>

Application	Hours/day
Small, quick- service restaurants	1
Medium-sized casual dining restaurants	1.5
Large institutional establishments with cafeteria	3

DAYSyear = Days per year pre-rinse spray valve is used at the site, custom, otherwise 312 days/yr based on assumed 6 days/wk x 52 wk/yr = 312 day/yr.

<sup>&</sup>lt;sup>95</sup> The baseline equipment is assumed to be 1.6 gallons per minute. The Energy Policy Act (EPAct) of 2005 sets the maximum flow rate for pre-rinse spray valves at 1.6 gallons per minute at 60 pounds per square inch of water pressure when tested in accordance with ASTM F2324-03. This performance standard went into effect January 1, 2006. www1.eere.energy.gov/femp/pdfs/spec\_prerinsesprayvavles.pdf.

<sup>&</sup>lt;sup>96</sup> Verification measurements taken at 195 installations showed average pre flowrates of 2.23 gallons per minute. IMPACT AND PROCESS EVALUATION FINAL REPORT for CALIFORNIA URBAN WATER CONSERVATION COUNCIL 2004-5 PRERINSE SPRAY VALVE INSTALLATION PROGRAM (PHASE 2) (PG&E Program # 1198-04; SoCalGas Program 1200-04) ("CUWCC Report," Feb 2007).

<sup>&</sup>lt;sup>97</sup> 1.6 gallons per minute used to be the high efficiency flow, but more efficient spray valves are available ranging down to 0.64 gallons per minute per Federal Energy Management Program which references the Food Services Technology Center web site with the added note that even more efficient models may be available since publishing the data. The average of the nozzles listed on the FSTC website is 1.06.

<sup>&</sup>lt;sup>98</sup> Hours primarily based on PG& E savings estimates, algorithms, sources (2005), Food Service Pre-Rinse Spray Valves.

# 2.4 Hot Water

# 2.4.1 Low Flow Faucet Aerator

# DESCRIPTION

This measure relates to the direct installation of a low flow faucet aerator in a commercial building. Expected applications include small business, office, restaurant, or motel. For multifamily or senior housing, the residential low flow faucet aerator should be used.

This measure was developed to be applicable to the following program type: DI.

If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure the installed equipment must be an energy efficient faucet aerator, for bathrooms rated at 1.5 gallons per minute (GPM) or less, or for kitchens rated at 2.2 GPM or less. Savings are calculated on an average savings per faucet fixture basis.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is assumed to be a standard bathroom faucet aerator rated at 2.25 GPM or more, or a standard kitchen faucet aerator rated at 2.75 GPM or more.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 9 years.<sup>99</sup>

#### **DEEMED MEASURE COST**

The incremental cost for this measure is \$8.00<sup>100</sup> or program actual

#### LOADSHAPE

Water Heating BUS

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Note these savings are per faucet retrofitted.<sup>101</sup>

<sup>&</sup>lt;sup>99</sup> Table C-6, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007. "http://neep.org/uploads/EMV%20Forum/EMV%20Studies/measure\_life\_GDS%5B1%5D.pdf."

<sup>&</sup>lt;sup>100</sup> Direct-install price per faucet assumes cost of aerator and install time. (2011, Market research average of \$3 and assess and install time of \$5 (20min @ \$15/hr).

<sup>&</sup>lt;sup>101</sup> This algorithm calculates the amount of energy saved per aerator by determining the fraction of water consumption savings for the upgraded fixture. Due to the distribution of water consumption by fixture type, as well as the different number of fixtures in a building, several variables must be incorporated.

Where:

ΔkWh = %ElectricDHW \* ((GPM\_base - GPM\_low)/GPM\_base) \* Usage \* EPG\_electric \*

#### ISR

() Here:			
%ElectricDHW	= proportion of water	heating supplied by el	lectric resistance heating
	DHW fuel	%Electric_DHW	
	Electric	100%	
	Fossil Fuel	0%	
	Unknown	43% <sup>102</sup>	
GPM_base	= Average flow rate,	in gallons per minute,	of the baseline faucet "as-used"
	$= 1.2^{104}$ or custom ba	sed on metering studie	es <sup>103</sup>
GPM_low	= Average flow rate, "as-used"	in gallons per minute,	of the low-flow faucet aerator
	$= 0.94^{104}$ or custom b	based on metering stud	ies <sup>105106107108</sup>
Usage	line and cold-water li = If data is available t	ne) per faucet (gallons to provide a reasonable	re of hot water from water heater s per year) e custom estimate it should be bstitute custom information in

<sup>&</sup>lt;sup>102</sup> Default assumption for unknown fuel is based on EIA Commercial Building Energy Consumption Survey (CBECS) 2012 for Midwest North Central Region (see 'HC8.9 Water Heating in Midwest Region.xls'). If utilities have specific evaluation results providing a more appropriate assumption for buildings in a particular market or geographical area, then they should be used. <sup>104</sup> Representative baseline flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use.

<sup>&</sup>lt;sup>103</sup> Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

<sup>&</sup>lt;sup>104</sup> Average retrofit flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. Assumes all kitchen aerators at 2.2 gpm or less and all bathroom aerators at 1.5 gpm or less. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use. It is possible that programs installing low-flow aerators lower than the 2.2 gpm for kitchens and 1.5 gpm for bathrooms will see a lower overall average retrofit flow rate.

<sup>&</sup>lt;sup>105</sup> Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

<sup>&</sup>lt;sup>106</sup> Table 2-45 Chapter 49, Service Water Heating, 2007 ASHRAE Handbook, HVAC Applications.

<sup>&</sup>lt;sup>107</sup> Estimated based on data provided in Appendix E, "Waste Not, Want Not: The Potential for Urban Water Conservation in California," http://www.pacinst.org/reports/urban\_usage/appendix\_e.pdf.

<sup>&</sup>lt;sup>108</sup> Based on review of the Illinois plumbing code (Employees and students per faucet). Retail, grocery, warehouse and health are estimates. Meals per faucet estimated as 4 bathroom and 3 kitchen faucets and average meals per day of 250 (based on California study above) -250/7 = 36. Fast food assumption estimated.

# 2.4.2 Circulator Pump

#### DESCRIPTION

Demand control recirculation pumps seek to reduce inefficiency by combining control via temperature and demand inputs, whereby the controller will not activate the recirculation pump unless both (a) the recirculation loop return water has dropped below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

This measure was developed to be applicable to the following program types: TOS, RF, and NC. If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

Re-circulating pump shall cycle on based on (a) the recirculation loop return water dropping below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

#### **DEFINITION OF BASELINE EQUIPMENT**

The base case for this measure category is an existing, un-controlled recirculation pump on a gas-fired Central Domestic Hot Water System.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The effective useful life is 15 years.<sup>114</sup>

#### DEEMED MEASURE COST

The assumed measure cost is \$1,200 per pump.<sup>115</sup>

#### LOADSHAPE

# 2.4.3 Heat Pump Water Heater

## DESCRIPTION

This measure applies to the installation of a heat pump water heater (HPWH) in place of a standard electric water heater in a commercial building. Savings are presented dependent on the heating system installed in the building due to the impact of the heat pump water heater on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOSNC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a heat pump water heater meeting program efficiency requirements.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is assumed to be a new, electric storage water heater meeting federal minimum efficiency standards.<sup>118</sup>

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 13 years.<sup>121</sup>

# **DEEMED MEASURE COST**

Actual costs should be used where available. Incremental capital costs are presented in the table below for heat pump water heaters with energy factors (EF) of 2.0 and 2.4 and rated volumes of 40 gallons and 50 gallons, respectively.<sup>119</sup>

EF	Rated Volume (gal)	Incremental Cost
2.0	40	\$1,340.30
2.4	50	\$1,187.58

For larger heat pump water heaters, incremental capital costs are presented in the table below based on heating capacity.<sup>120</sup>

Heating Capacity (MBtu/hr)	Incremental Cost
10-50	\$4,000.00
>50-100	\$7,000.00
>100-300	\$10,000.00

<sup>&</sup>lt;sup>118</sup> Federal standards for  $\leq$ 55 gallon and  $\leq$ 12 kW storage water heaters are from 10 CFR §430.32(d). Federal standards for >120 gallon and>12 kW storage water heaters are from 10 CFR §431.110. Since the federal standard effectively requires a heat pump water heater for residential electric storage water heaters >55 gallons and  $\leq$ 120 gallons, this measure excludes those units. <sup>121</sup> 2010 Residential Heating Products Final Rule Technical Support Document, U.S. DOE, Table 8.7.2.

<sup>&</sup>lt;sup>119</sup> Cost information is based upon data from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014. See "NR HW Heater\_WA017\_MCS Results Matrix - Volume I\_August2016.xls" for more information.

<sup>&</sup>lt;sup>120</sup> Costs for larger heat pump water heaters are from 2017 Michigan Energy Measures Database.xlsx and are based on heat pump water heaters with a COP  $\geq$  3.0.

>300-500	\$14,000.00
Heating Capacity (MBtu/hr)	Incremental Cost
>500	\$18,000.00

## LOADSHAPE

Water Heating BUS

# Algorithm

# CALCULATION OF SAVINGS

# **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = ((1/EF_{BASE} - 1/EF_{EE}) * HotWaterUseGallon * \gamma Water * (TOut - TIn) * 1.0)3,412) + kWh_cool - kWh_heat$ 

#### Where:

 $EF_{BASE}$  = Efficiency of baseline water heater according to federal standards, expressed as Energy Factor (EF) or Thermal Efficiency (E<sub>t</sub>) = See table below

0,	( )	
Equipment Type	Size Category	Federal Standard Minimum Efficiency
HPWH ≤12 kW	≤55 gallon	EF: $0.96 - (0.0003 * \text{ rated volume in gallons})$
HPWH >12kW	>120 gallon	Et: 98% <sup>121</sup>

 $EF_{EE} = EF$  of heat pump water heater

= Actual

HotWaterUse<sub>Gallon</sub> = Estimated annual hot water consumption (gallons)

= Actual if possible to provide reasonable custom estimate. If not, two methodologies are provided to develop an estimate:

1. Consumption per water heater capacity

= Consumption/cap \* Capacity Where:

Consumption/cap = Estimate of consumption per gallon of tank capacity, dependent on building type:<sup>122</sup>

<sup>&</sup>lt;sup>121</sup> Efficiency of baseline water heaters >120 gallons based on search of electric storage water heaters >120 gallons available on AHRI directory.

<sup>&</sup>lt;sup>122</sup> Based on Cadmus analysis. Annual hot water usage in gallons based on CBECS (2003) consumption data for West North Central (removed outliers of 1,000 kBtu/hr or less) to calculate hot water usage. Annual hot water gallons per tank size gallons based on the tank sizing methodology found in ASHRAE 2011 HVAC Applications. Chapter 50 Service Water Heating. Demand assumptions (gallons per day) for each building type based on ASHRAE Chapter 50 and "Technology Data Characterizing Water Heating in Commercial Buildings: Application to End Use Forecasting," Lawrence Berkeley National Library, December 1995. VEIC considers these values to be relatively conservative estimates that may benefit from future evaluation.

<sup>&</sup>lt;sup>124</sup> Ideally, the actual set point of the water heater should be used. If not available, 125 degrees is provided as an estimate of unmixed output temperature. While plumbing code generally limits temperatures at the end use, it typically does not limit the water heater system, which can be anywhere in the range 120-201 degrees. For applications such as laundry and dishwashing, health and safety regulations may require water to be initially heated to higher temperatures. Since temperature set points can vary widely, market, program, or site-specific data should be used whenever possible.

<sup>127</sup> Professional judgment.

<sup>&</sup>lt;sup>125</sup> Using 40" deep soil temp as a proxy at Powell Gardens SCAN site. Average by month of available data from 3/28/02–10/11/14: <sup>126</sup> This algorithm calculates the heat removed from the air by subtracting the heat pump water heater electric consumption from the total water heating energy delivered. This is then adjusted to account for location of the heat pump unit and the coincidence of the waste heat with cooling requirements, the efficiency of the central cooling, and latent cooling demands.

<sup>&</sup>lt;sup>128</sup> Based on 193 days where CDD 65>0, divided by 365.25. CDD days determined from TMY data with a base temp of 65°F.

<sup>&</sup>lt;sup>129</sup> The Latent Multiplier is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

kWh\_heat = Heating cost from conversion of heat in building to water heat (dependent on heating fuel)

# 2.5.1 Small Commercial Learning Thermostats

### DESCRIPTION

This measure characterizes the energy savings from the installation of a new programmable thermostat for reduced cooling and heating energy consumption through temperature set-back during unoccupied or reduced demand times as well as automatic adjustments based on occupancy patterns and various independent variables such as weather. This measure is limited to small businesses as defined by programs,<sup>133</sup> as they have smaller HVAC systems that are similar to residential HVAC systems and may be controlled by a simple manual adjustment thermostat. Mid- to large-sized businesses will typically have a building automation system or some other form of automated HVAC controls. This measure is only appropriate for single zone heating systems. Custom calculations are required for savings for learning thermostats installed in multi-zone systems.

This measure was developed to be applicable to the following program types: RF, DI, and TOS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature set-points according to various independent variables without manual intervention.

#### **DEFINITION OF BASELINE EQUIPMENT**

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change the temperature set-point.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a learning thermostat is assumed to be 10 years<sup>134</sup> based upon equipment life only.<sup>135</sup>

#### DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown, the capital cost for this measure is assumed to be \$224.<sup>136</sup>

#### LOADSHAPE

### 2.5.3 Demand Controlled Ventilation

### DESCRIPTION

Demand control ventilation (DCV) automatically adjusts building ventilation rates based on occupancy. DCV is part of a building's ventilation system control strategy. It may include hardware, software, and controls as an integral part of a building's ventilation design. Active control of the ventilation system provides the opportunity to reduce heating and cooling energy use.

The primary component is a control sensor to communicate either directly with the economizer or with a central computer. The component is most typically a carbon dioxide  $(CO_2)$  sensor, occupancy sensor, or turnstile counter. This measure is modeled to assume night time set backs are in operation and minimum outside air is being used when the building is unoccupied.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment condition is defined by new  $CO_2$  sensors installed on return air systems where no other sensors were previously installed. Additionally, commissioned control logic and installed hardware must be capable of reducing ventilation rates based on sensor input. For heating savings, this measure does not apply to any system with terminal reheat (constant volume or variable air volume). For terminal reheat system a custom savings calculation should be used.

### **DEFINITION OF BASELINE EQUIPMENT**

The base case for this measure is a space with no demand control capability. The current code minimum for outside air (OA) is 17 CFM per occupant (ASHRAE 62.1) which is the value assumed in this measure.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed measure life is 10 years.<sup>146</sup>

### **DEEMED MEASURE COST**

As a retrofit measure, the actual cost of installation should be used for screening. Costs should include the hardware and labor costs to install the sensors. Additional purchase and installation costs for any other component of the DCV system that was not previously existing should also be included.

### LOADSHAPE

Cooling BUS

### Algorithm

### CALCULATION OF ENERGY SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

For facilities heated by natural gas, cooling savings are:

 $<sup>^{146}</sup>$  Based on CO<sub>2</sub> sensor estimated life, determined through conversations with contractors to have a minimum lifetime of 10 years. It is recommended that they are part of a normal preventive maintenance program, as calibration is an important part of extending useful life. Although they are not subject to mechanical failure, they can fall out of tolerance over time.

 $\Delta kWh = SQFT_{cond}/1000 * SF_{cooling}$ 

For facilities heated by heat pumps, heating and cooling savings are:

$$\Delta kWh = SQFT_{cond}/1000 * SF_{cooling} + SQFT_{cond}/1000 * SF_{Heat HP} For$$

facilities heated by electric resistance heating and cooling savings are:

 $\Delta kWh = SQFT_{cond}/1000 * SF_{cooling} + SQFT_{cond}/1000 * SF_{Heat ER}$  Where:

 $SQFT_{cond}$ 

= Square footage of conditioned space commissioned with DCV

SF<sub>cooling</sub>

= square rootage of conditioned space commissioned with DCV

<sup>ooling</sup> = Cooling Savings Factor, including cooling and fan energy savings

 $SF_{Heat HP}$ 

= Heating Savings factor for facilities heated by Heat Pump (HP)

 $SF_{Heat ER}$  = Heating Savings factor for facilities heated by Electric Resistance (ER)

All Savings Factors are based on building type and weather zone, as listed in the following tables:<sup>147</sup>

		SF <sub>cooling</sub> (kWh/1000 SqFt)

<sup>&</sup>lt;sup>147</sup> Energy savings factors were calculated using weather data and methodology consistent with ASHRAE standards. Savings are calculated on an annual basis for each given weather zone in Missouri. Original energy savings for DCV were developed for Illinois utilizing standards, inputs and approaches as set forth by ASHRAE 62.1 and 90.1. These savings factors were then translated into Missouri-specific values using adjustment factors based on differences in heating and cooling degree hours. See DCV savings factors v1.xlsx for derivation.

### 2.5.4 Advanced Roof Top Unit (RTU) Controls

### DESCRIPTION

A traditional packaged HVAC rooftop unit uses a zone thermostat to control the operation of the compressor or the gas furnace, depending on whether the zone thermostat is calling for cooling or heating. Under a conventional control scheme, the compressor or furnace is cycled on or off to maintain the zone thermostat set point with the supply fan operating continuously (when the building is occupied) to provide sufficient ventilation air and provide comfort heating and cooling for the space. The supply-fan speed is typically not capable of modulation, so it supplies constant air volume under all modes of operations.

Modulating the supply fan in conjunction with demand-controlled ventilation (DCV) can reduce both heating/cooling energy and fan energy requirements. This measure describes the energy savings realized by retrofitting traditional RTUs with advanced controllers that enable integrated air-side economization, supply-fan speed control (by installing a variable speed drive), and demand-controlled ventilation.

This measure is applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

A traditional RTU retrofitted and commissioned with advanced controls that allow for modulation of supply fan speed in conjunction with demand-controlled ventilation (DCV).

### **DEFINITION OF BASELINE EQUIPMENT**

Packaged heating and cooling equipment with constant speed supply fans providing ventilation at the design rate at all times when the fan is operating and when the building is occupied.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.<sup>148</sup>

### **DEEMED MEASURE COST**

As a retrofit measure, actual costs should be specified when available. Default measure costs are listed below based on RTU supply fan horsepower rating:<sup>149</sup>

Supply Fan <sup>154</sup> Size (hp)	Controller	Installation Labor	Total Retrofit Cost
1	\$2,200	\$750	\$2,950
2	\$2,600	\$750	\$3,350
3	\$3,500	\$750	\$4,250
5	\$4,000	\$750	\$4,750
7.5	\$4,142	\$750	\$4,892

LOADSHAPE HVAC BUS

<sup>&</sup>lt;sup>148</sup> Consistent with other HVAC variable speed drive lifetimes.

<sup>&</sup>lt;sup>149</sup> Advanced Rooftop Control (ARC) Retrofit: Field-Test Results, PNNL-22656. U.S. Department of Energy, July 2013. <sup>154</sup> Interpolation may be used to estimate controller cost for motor sizes not listed.

### Algorithm

### CALCULATION OF SAVINGS

Although advanced RTUs controls can enable operating strategies that result in heating and cooling savings, field testing has shown variable results (in some instances increased heating/cooling energy consumption has been observed). Field testing has suggested that upwards of 90% of total energy savings can be attributed to reduced fan energy requirements, and therefore the following savings estimates are limited to those relating to fan energy consumption.

### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = P_{sf} * SF * Hours_{fan}$ 

Where:

$\mathbf{P}_{\mathrm{sf}}$	= Nominal horsepower of supply fan motor
SF	= Fan energy savings factor <sup>150</sup> (kWh/hour/horsepower)
	= 0.558

Hours<sub>fan</sub> = Annual operating hours for fan motor based on building type.

Default hours are provided for HVAC applications which vary by building type.<sup>151</sup> When available, actual hours should be used, especially in instances where RTU operation is seasonal.

	Total
Building Type	Fan Run Hours
Large Office	6753
Medium Office	6968
Small Office	6626
Warehouse	6263
Stand-alone Retail	6679
Strip Mall	6687
Primary School	5906
Secondary School	6702
Supermarket	6900
Quick Service Restaurant	7679
Full Service Restaurant	7664
Hospital	8760
Outpatient Health Care	8760
Small Hotel - Building	8760
Large Hotel - Building	8760
Midrise Apartment Building	8728
Nonresidential Average	6773

<sup>&</sup>lt;sup>150</sup> Based on average field testing results outlined in Advanced Rooftop Control (ARC) Retrofit: Field-Test Results, PNNL-22656. U.S. Department of Energy, July 2013. Savings factors were consistent across the capacity range. See "RTU Control Savings.xlsx" for additional details.

<sup>&</sup>lt;sup>151</sup> Hours per year are estimated using the modeling results and represent the total number of hours the fans are operating for heating, cooling and ventilation for each building type.

### SUMMER COINCIDENT PEAK DEMAND SAVINGS

	$\Delta k = kWh * CF$ Where:
$\Delta kWh$	= As calculated above.
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor
	= 0.0004439830

### NATURAL GAS ENERGY SAVINGS

If fossil fuel impacts are expected, a custom analysis should be used to support them.

### WATER IMPACT DESCRIPTIONS AND CALCULATION

### 2.5.5 Electric Chiller

### DESCRIPTION

This measure involves the installation of a new electric chiller meeting the efficiency standards presented below. This measure could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in an existing building (i.e. time of sale). Only single-chiller applications should be assessed with this methodology. The characterization is not suited for multiple chillers projects or chillers equipped with variable speed drives (VSDs), for which a custom analysis should be used to establish savings.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline equipment is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of International Energy Conservation Code (IECC). Depending on the version, this will correspond to the requirements defined within Table 503.2.3(7) in the case of IECC 2009 or Table 403.2.3(7) in the case of either IECC 2012 or the IECC 2015.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.<sup>152</sup>

### **DEEMED MEASURE COST**

The incremental capital cost for this measure is \$106.23 per ton.<sup>153</sup>

Algorithm

### CALCULATION OF SAVINGS

### **ELECTRIC ENERGY SAVINGS**

$$\Delta kWH = TONS * ((IPLV base) - (IPLV ee)) * EFLH$$

Where:

TONS	= Chiller nominal cooling capacity in tons (note: 1 ton = 12,000 Btu/hr)
	= Actual installed
<b>IPLV</b> <sub>base</sub>	=Efficiency of baseline equipment expressed as Integrated Part Load Value (kW/ton). Chiller units are dependent on chiller type. See 'Chiller Units, Conversion Values' and 'Baseline Efficiency Values by Chiller Type' and Capacity in the Reference Tables section.
IPLVee <sup>154</sup>	<ul> <li>= Efficiency of high efficiency equipment expressed as Integrated Part Load Value (kW/ton)<sup>155</sup></li> <li>= Actual installed</li> </ul>
EFLH	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC

<sup>&</sup>lt;sup>154</sup> Integrated Part Load Value is a seasonal average efficiency rating calculated in accordance with ARI Standard 550/590. It may be calculated using any measure of efficiency (EER, kW/ton, COP), but for consistency, it is expressed in terms of IPLV here.

<sup>&</sup>lt;sup>155</sup> Can determine IPLV from standard testing or looking at engineering specs for design conditions. Standard data is available from AHRnetI.org. http://www.ahrinet.org/.

### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWH * CF$ 

Where:

$\Delta kWH$	= Annual electricity savings, as calculated above
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor for Cooling = 0.0009106840

### **REFERENCE TABLES**

Chillers Ratings- Chillers are rated with different units depending on equipment type as shown below

Equipment Type	Unit
Air cooled, electrically operated	EER
Water cooled, electrically operated, positive displacement (reciprocating)	kW/ton
Water cooled, electrically operated, positive displacement (rotary screw and scroll)	kW/ton

In order to convert chiller equipment ratings to IPLV the following relationships are provided kW/ton = 12 / EER

kW/ton	= 12 / (COP x 3.412)
COP	= EER / 3.412
COP	= 12 / (kW/ton) / 3.412
EER	= 12 / kW/ton
EER	= COP x 3.412
Baseline Effi	ciency Values by Chiller Type and Capacity:

Note: Efficiency requirements depend on the path (Path A or Path B) that the building owner has chosen to meet compliance requirements. For air cooled and absorption chillers, Path A should be assumed. For water cooled chillers, the building owner should be consulted and the relevant path used for calculations. When unknown, Path A should be used.

#### TABLE 503.2.3(7) WATER CHILLING PACKAGES, EFFICIENCY REQUIREMENTS\*

For SI: 1 ton = 907 kg, 1 British thermal unit per hour = 0.2931 W

a. The chiller equipment requirements do not apply for chillers used in ICMT-temperature applications where the design leaving fluid temperature is < 40°F.

b. Section 12 contains a complete specification of the referenced test procedure, induding the referenced year VERSION of the test procedure.

c. Compliance with this standard can be obtained by meeting the minimum requirements of Path A or B. However, both the full load and IPLV must be met to fulfill the requirements of Path A or B.

d. NA means that this requirement is not applicable and cannot be used for compliance.

#### TABLE C403.2.3(7) MINIMUM EFFICIENCY REQUIREMENTS: WATER CHILLING PACKAGES\*

For SI: 1 ton = 3517 W, 1 British thermal unit per hour = 0.2931 W, °C = [(°F) - 32]/1.8.

NA = Not applicable, not to be used for compliance; NR = No requirement.

a. The centrifugal chiller equipment requirements, after adjustment in accordance with Section C403.2.3.1 or Section C403.2.3.2, do not apply to chillers used in low-temperature applications where the design leaving fluid temperature is less than 36%. The requirements do not apply to positive displacement chillers with leaving fluid temperatures less than or equal to 32%. The requirements do not apply to absorption chillers with design leaving fluid temperatures less than 40%F.

b. Compliance with this standard can be obtained by meeting the minimum requirements of Path A or B. However, both the full load and IPLV shall be met to fulfill the requirements of Path A or B.

c. Chapter 6 of the referenced standard contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.

### 2015 IECC Baseline Efficiency Values by Chiller Type and Capacity

a. The requirements for centrifugal chiller shall be adjusted for nonstandard rating conditions in accordance with Section C403.2.3.1 and are only applicable for the range of conditions listed in Section C403.2.3.1. The requirements for air-cooled, water-cooled positive displacement and absorption chillers are at standard rating conditions defined in the reference test procedure.
 b. Both the full-load and IPLV requirements shall be met or exceeded to comply with this standard. Where there is a Path B, compliance can be with either Path A or Path B for any application.

c. NA means the requirements are not applicable for Path B and only Path A can be used for compliance.
 d. FL represents the full-load performance requirements and IPLV the part-load performance requirements.

### 2.5.6 Heat Pump Systems

### DESCRIPTION

This measure applies to the installation of high efficiency air-cooled, water source, ground water source, and ground source heat pump systems. This measure could apply to replacing an existing unit at the end of its useful life, or installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

For this characterization to apply, the efficient equipment is assumed to be a high-efficiency air- cooled, water source, ground water source, or ground source heat pump system that exceeds both the full load and part load energy efficiency requirements specified by the building code applicable to local jurisdiction. This may be a version of the 2009, 2012 or 2015 International Energy Conservation Code (IECC) or ASHRAE 90.1 standard.

### **DEFINITION OF BASELINE EQUIPMENT**

For this characterization to apply, the baseline equipment is assumed to be a standard-efficiency air- cooled, water source, ground water source, or ground source heat pump system that meets the energy efficiency requirements of local building code. The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>156</sup>

### **DEEMED MEASURE COST**

For analysis purposes, the incremental capital cost for this measure is assumed as \$100 per ton for air-cooled units.<sup>157</sup> The incremental cost for all other equipment types should be determined on a site-specific basis.

Algorithm

### CALCULATION OF SAVINGS

### **ELECTRIC ENERGY SAVINGS**

For units with cooling capacities less than 65 kBtu/hr:

 $\Delta kWh = Annual kWh Savings_{cool +} Annual kWh Savings_{heat}$ 

Annual kWh Savings<sub>cool</sub> =  $(kBtu/hr_{cool}) * [(1/SEERbase) - (1/SEERee)] * EFLH_{cool}$ 

<sup>&</sup>lt;sup>156</sup> Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

<sup>&</sup>lt;sup>157</sup> Based on a review of TRM incremental cost assumptions from Vermont, Wisconsin, and California.

Annual kWh Savings<sub>heat</sub> =  $(kBtu/hr_{heat}) * [(1/HSPFbase) - (1/HSPFee)] * EFLH_{heat}$  For units with cooling capacities equal to or greater than 65 kBtu/hr:

$\Delta kWh = Annual \ kWh \ Savings_{cool +} Annual \ kWh \ Savings_{heat}$						
Annual kWh Savingscool	= $(kBtu/hr_{cool}) * [(1/IEERbase) - (1/IEERee)] * EFLH_{cool}$					
Annual kWh Savingsheat	= $(kBtu/hr_{heat})/3.412 * [(1/COPbase) - (1/COPee)] * EFLH_{heat}$					

Where:

kBtu/hr <sub>cool</sub>	= Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/hr).
	= Actual installed
SEERbase	=Seasonal Energy Efficiency Ratio of the baseline equipment
	= SEER from tables below, if applicable code is based on IECC, or custom input as necessary.
SEERee	= Seasonal Energy Efficiency Ratio of the energy efficient equipment.
	= Actual installed
EFLH <sub>cool</sub>	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC End Use.
HSPFbase	= Heating Seasonal Performance Factor of the baseline equipment
	= HSPF from tables below, if applicable code is based on IECC, or custom input as necessary.
HSPFee	= Heating Seasonal Performance Factor of the energy efficient equipment.
	= Actual installed. If rating is COP, $HSPF = COP * 3.413$
EFLHheat	= Heating mode equivalent full load hours are provided in section 2.7 HVAC End Use.
IEERbase	= Integrated Energy Efficiency Ratio of the baseline equipment
	= IEER from tables below, based on the applicable IECC.
IEERee	= Integrated Energy Efficiency Ratio of the energy efficient equipment.
	= Actual installed
kBtu/hr <sub>heat</sub>	= Capacity of the heating equipment in kBtu per hour.
	= Actual installed
3.412	= Btu per Wh.
COPbase	= Coefficient of performance of the baseline equipment
	ables below, based on the applicable IECC. If rating is HSPF, $COP = HSPF / 3.413$
COPee	= Coefficient of performance of the energy efficient equipment.
	= Actual installed

### 2.5.7 Packaged Terminal Air Conditioner (PTAC) - Packaged Terminal Heat Pump (PTHP)

### DESCRIPTION

A PTAC is a packaged terminal air conditioner that cools and provides heat through an electric resistance heater (heat strip). A PTHP is a packaged terminal heat pump. A PTHP uses its compressor year-round to heat or cool. In warm weather, it efficiently captures heat from inside a space and pumps it outside for cooling. In cool weather, it captures heat from outdoor air and pumps it into a space, adding heat from electric heat strips as necessary to provide heat.

This measure characterizes:

- a) Time of Sale: the purchase and installation of a new efficient PTAC or PTHP.
- b) Early Replacement: the early removal of an existing PTAC or PTHP from service, prior to its natural end of life, and replacement with a new efficient PTAC or PTHP unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life. The measure is only valid for non-fuel switching installations for example replacing a cooling only PTAC with a PTHP can currently not use the TRM.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to be PTACs or PTHPs that exceed baseline efficiencies.

### **DEFINITION OF BASELINE EQUIPMENT**

TOS: the baseline conditions is provided in the Federal Baseline reference table provided below.

EREP: the baseline is the existing PTAC or PTHP for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>158</sup>

Remaining life of existing equipment is assumed to be 5 years.<sup>159</sup>

### **DEEMED MEASURE COST**

TOS: The incremental capital cost for this equipment is estimated to be \$84/ton.<sup>160</sup>

EREP: The measure cost is the full cost of removing the existing unit and installing a new one. The actual program cost should be used. If unknown assume \$1,047 per ton.<sup>161</sup>

 <sup>&</sup>lt;sup>158</sup> Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007
 <sup>159</sup> Standard assumption of one third of effective useful life.

<sup>&</sup>lt;sup>160</sup> DEER 2008. This assumes that baseline shifts between IECC versions carries the same incremental costs. Values should be verified during evaluation

<sup>&</sup>lt;sup>161</sup> Based on DCEO – IL PHA Efficient Living Program data.

The assumed deferred cost (after 5 years) of replacing existing equipment with new baseline unit is assumed to be \$1,039 per ton.<sup>162</sup> This cost should be discounted to present value using the utilities' discount rate.

#### LOADSHAPE

Cooling BUS

### Algorithm

### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Electric savings for PTACs and PTHPs should be calculated using the following algorithms

#### **ENERGY SAVINGS TOS:**

PTAC $\Delta kWh^{163}$	= Annual kWh Savings <sub>cool</sub>
PTHP $\Delta kWh$	= Annual kWh Savings <sub>cool +</sub> Annual kWh Savings <sub>heat</sub>
Annual kWh Savingscool	= (kBtu/hr <sub>cool</sub> ) * [(1/EERbase) – (1/EERee)] * EFLH <sub>cool</sub>
Annual kWh Savingsheat E	REP: = $(kBtu/hr_{heat})/3.412 * [(1/COPbase) - (1/COPee)] * EFLH_{heat}$

$\Delta$ kWh for remaining life of existing unit (1 <sup>st</sup> 5years)	= Annual kWh Savings <sub>cool +</sub> Annual kWh
	Savings

	Savingsheat
Annual kWh Savingscool	= (kBtu/hr <sub>cool</sub> ) * [(1/EERexist) – (1/EERee)] * EFLH <sub>cool</sub>
Annual kWh Savingsheat	= (kBtu/hr <sub>heat</sub> )/3.412 * [(1/COPexist) – (1/COPee)] * EFLH <sub>heat</sub>
$\Delta$ kWh for remaining measure life (next	10 years) = Annual kWh Savings <sub>cool +</sub> Annual

kWh Savingsheat

Annual kWh Savings<sub>cool</sub> =  $(kBtu/hr_{cool}) * [(1/EERbase) - (1/EERee)] * EFLH_{cool}$ 

Annual kWh Savingsheat	= $(kBtu/hr_{heat})/3.412 * [(1/COPbase) - (1/COPee)] * EFLH_{heat}$
------------------------	--

Where:

 $kBtu/hr_{cool}$  = Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/hr).

= Actual installed

EFLH<sub>cool</sub> = Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC End Use:

EFLH<sub>heat</sub> = Equivalent Full Load Hours for heating are provided in section 2.7 HVAC End Use

EERexist = Energy Efficiency Ratio of the existing equipment

= Actual. If unknown assume  $8.1 \text{ EER}^{164}$ 

<sup>&</sup>lt;sup>162</sup> Based on subtracting TOS incremental cost from the DCEO data and incorporating inflation rate of 1.91%.

<sup>&</sup>lt;sup>163</sup> There are no heating efficiency improvements for PTACs since although some do provide heating, it is always through electric resistance and therefore the COPbase and COPee would be 1.0.

<sup>&</sup>lt;sup>164</sup> Estimated using the IECC building energy code up until year 2003 (p107;

https://law.resource.org/pub/us/code/ibr/icc.iecc.2000.pdf) and assuming a 1 ton unit; EER = 10 - (0.16 \* 12,000/1,000) = 8.1.

- EERbase = Energy Efficiency Ratio of the baseline equipment.
- = See the table below for requirements where local code is based on IECC. Content is based on tables 503.3.3(3) (IECC 2009) and C403.2.3(3) (IECC 2012, 2015): Minimum Efficiency Requirements: Electrically operated packaged terminal air conditioners, packaged terminal heat pumps. An alternate, custom input may be necessary for jurisdictions recognizing alternative code.

Equipment Type	IECC 2009	IECC 2012 Minimum	<b>IECC 2015</b>

Replacements	Cap/1000) COP	COP	COP	

"Cap" = The rated cooling capacity of the project in Btu/hr. If the unit's capacity is less than 7000 Btu/hr, use 7,000 Btu/hr in the calculation. If the unit's capacity is greater than 15,000 Btu/hr, use 15,000 Btu/hr in the calculations.

Replacement unit shall be factory labeled as follows: "MANUFACTURED FOR
REPLACEMENT APPLICATIONS ONLY; NOT TO BE INSTALLED IN NEW
CONSTRUCTION PROJECTS," Replacement efficiencies apply only to units
with existing sleeves less than 16 inches (406mm) in height and less than 42 inches
(1067 mm) in width.
- Energy Efficiency Ratio of the energy efficient equipment. For air-cooled units

- EERee = Energy Efficiency Ratio of the energy efficient equipment. For air-cooled units < 65 kBtu/hr, if the actual EERee is unknown, assume the following conversion from SEER to EER for calculation of peak savings:<sup>165</sup> EER = (-0.02 \* SEER<sup>2</sup>) + (1.12 \* SEER) = Actual installed
- kBtu/hr<sub>heat</sub> = Capacity of the heating equipment in kBtu per hour.
   = Actual installed
   3.412 = Btu per Wh.
- COPexist = Coefficient of performance of the existing equipment

<sup>&</sup>lt;sup>165</sup> Based on Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Masters Thesis, University of Colorado at Boulder. Note this is appropriate for single speed units only.

		= Actual. If unknown assume 1.0 COP for PTAC units and 2.6 $COP^{166}$ for PTHPs.
COPb	ase	= Coefficient of performance of the baseline equipment; see table above for values.
COPe	e	= Coefficient of performance of the energy efficient equipment.
		= Actual installed

### 2.5.8 Single-Package and Split System Unitary Air Conditioner

### DESCRIPTION

This measure promotes the installation of high-efficiency unitary air-, water-, and evaporatively cooled air conditioning equipment, both single-package and split systems. Air conditioning (AC) systems are a major consumer of electricity and systems that exceed baseline efficiencies can save considerable amounts of energy. This measure could apply to the replacement of an existing unit at the end of its useful life or the installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to be a highefficiency air-, water-, or evaporatively cooled air conditioner that exceeds both the full load and part-load energy efficiency requirements specified by the building code applicable to local jurisdiction. This may be a version of the 2009, 2012 or 2015 IECC or ASHRAE 90.1 standard.

#### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline equipment is assumed to be a standardefficiency air-, water, or evaporatively cooled air conditioner that meets the energy efficiency requirements of local building code. The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>167</sup>

#### **DEEMED MEASURE COST**

The incremental capital cost for this measure is assumed to be \$100 per ton.<sup>168</sup>

#### LOADSHAPE

Cooling BUS

Algorithm

### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

For units with cooling capacities less than 65 kBtu/hr:

<sup>&</sup>lt;sup>167</sup> Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

<sup>&</sup>lt;sup>168</sup> Based on a review of TRM incremental cost assumptions from Vermont, Wisconsin, and California. This assumes that baseline shift from between IECC versions carries the same incremental costs. Values should be verified during evaluation.

 $\Delta kWH = (kBtu/hr) * [(1/SEERbase) - (1/SEERee)] *$ 

EFLH For units with cooling capacities equal to or greater than

65 kBtu/hr:

 $\Delta kWH = (kBtu/hr) * [(1/IEERbase) - (1/IEERee)] *$ 

### EFLH Where:

kBtu/hr SEERbase	<ul> <li>= Capacity of the cooling equipment actually installed in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/hr)</li> <li>= Seasonal Energy Efficiency Ratio of the baseline equipment</li> </ul>
	= SEER values from tables below, if applicable code is based on IECC, or custom input as necessary.
SEERee	= Seasonal Energy Efficiency Ratio of the energy efficient equipment (actually installed)
IEERbase	= Integrated Energy Efficiency Ratio of the baseline equipment
	= IEER values from tables below, if applicable code is based on IECC, or custom input as necessary.
IEERee	= Integrated Energy Efficiency Ratio of the energy efficient equipment (actually installed.)
EFLH	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC End Use

### 2009 IECC Minimum Efficiency Requirements

### 2.5.9 High Volume Low Speed Fans

### DESCRIPTION

The measure applies to 20-24 foot diameter horizontally mounted ceiling high volume low speed (HVLS) fans that are replacing multiple non HVLS fans that have reached the end of useful life.

This measure was developed to be applicable to the following program types: TOS and RF If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to be classified as HVLS and have a VFD.<sup>169</sup>

### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline condition is assumed to be multiple non HVLS existing fans that have reached the end of useful life.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.<sup>170</sup>

#### **DEEMED MEASURE COST**

The incremental capital cost for the fans are as follows:<sup>171</sup>

Fan Diameter Size (feet)	Incremental Cost
20	\$4150
22	\$4180
24	\$4225

<sup>&</sup>lt;sup>174</sup>Fixtures hours of use are based upon schedule assumptions used in the computer models. Nonresidential Average is a weighted average of indoor spaces using the relative area of each building type in the region (CBECS).

<sup>&</sup>lt;sup>175</sup> The Waste Heat Factor for Energy is developed using computer models for the various building types. Exterior and garage values are 1, unknown is a weighted average of the other building types.

<sup>&</sup>lt;sup>176</sup>Summer peak coincidence demand (kW) to annual energy (kWh) factor. Calculated using modeling results and Ameren Missouri coincident peak demand methodology.

<sup>&</sup>lt;sup>177</sup> Electric heat penalty assumptions are based on converting the IFTherm multiplier value in to kWh and then applying relative heating system efficiencies. The gas efficiency was assumed to be 80% AFUE, electric resistance is assumed to be 100%, Heat Pump is assumed to be 2.3COP.

<sup>&</sup>lt;sup>178</sup> IF Therms value is developed using computer models consistent with methodology for Waste Heat Factor for Energy.

# 2.6.1 Fluorescent Delamping

# DESCRIPTION

This measure entails the permanent removal of an existing 4-foot or 8-foot T8 lamp and the associated lamp holders and ballasts from the fixture.

Customers are responsible for determining whether or not to use reflectors in combination with lamp removal in order to maintain adequate lighting levels. Lighting levels are expected to meet the Illuminating Engineering Society of North America (IESNA) recommended light levels. Unused lamps, lamp holders, and ballasts must be permanently removed from the fixture and disposed of in accordance with local regulations.

This measure was developed to be applicable to RF.

# **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition will vary depending on the existing fixture and number of lamps removed, however for the purposes of this measure, savings are defined on a per removed lamp basis. The retrofit wattage (efficient condition) is therefore assumed to be zero.

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is a T8 lamp with default wattages provided below.

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 11 years.<sup>179</sup>

#### **DEEMED MEASURE COST**

Measure	Cost
8-Foot Lamp Removal	\$16.00
4-Foot Lamp Removal	\$12.00
8-Foot Lamp Removal with reflector	\$30.00
4-Foot Lame Removal with reflector	\$25.00

# LOADSHAPE

Lighting BUS

# Algorithm

#### CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS<sup>180</sup>

$$Watts_{Base} - Watts_{EE}$$

$$\Delta kWh = \underline{\qquad} * Hours * WHFe * ISR$$

<sup>&</sup>lt;sup>179</sup> KCP&L measure life assumption.

<sup>&</sup>lt;sup>180</sup> The savings numbers are for the straight lamp removal measures, as well as the lamp removal and install reflector measures.

1,000

# Where:

Watts<sub>Base</sub> = Wattage reduction of lamp removed. Custom input, otherwise assume:

T8 Lamp Size	Wattage <sup>181</sup>	
8-ft T8	38.6	
4-ft T8	19.4	

# $Watts_{EE} = 0$

Hours = Average annual lighting hours of use as provided by the customer. If unknown, the default value based on building type may be selected from the Lighting Reference Table in Section 2.6.

# WHFe = Waste heat factor for energy to account for cooling energy savings from light removal is selected from the Lighting Reference Table in Section 2.6 for each building type. If building is un-cooled, the value is 1.0 and if unknown use C&I Average value.

ISR = In Service Rate, 100% since permanent removal is assumed.

# Heating Penalty<sup>182</sup>

If electrically heated building:

$$Watts_{Base} - Watts_{EE}$$

$$\Delta kWhheatpenalty = \underbrace{\qquad}_{1,000} * ISR * Hours * -IFkWh$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficent lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

<sup>&</sup>lt;sup>181</sup> Default wattage reduction is based on averaging the savings from moving from a 2 to 1, 3 to 2 and 4 to 3 lamp fixture, as provided in the Standard Performance Contract Procedures Manual: Appendix B: Table of Standard Fixture Wattages (http://www.sce.com/NR/rdonlyres/7A3455F0-A337-439B-9607-10A016D32D4B/0/spc B Std Fixture Watts.pdf).

An adjustment is made to the T8 delamped fixture to account for the significant increase in ballast factor that can be expected when delamping fixtures with parallel ballasts. See "Delamping calculation.xlsx" for details.

<sup>&</sup>lt;sup>182</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

 $\Delta k = \Delta kWh * CF$  Where: CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635

# NATURAL GAS ENERGY SAVINGS<sup>183</sup>

Heating Penalty if fossil fuel heated building (or if heating fuel is unknown):

 $\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * - IFTherms$ 

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficent lighting.Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

Other factors as defined above.

**MEASURE CODE:** 

<sup>&</sup>lt;sup>183</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

# 2.6.2 High Performance and Reduced Wattage T8 Fixtures and Lamps

# DESCRIPTION

This measure applies to High Performance T8 (HPT8) lamp/ballast systems that have higher lumens per watt than standard T8 systems. This measure applies to the installation of new equipment with efficiencies that exceed that of the equipment that would have been installed following standard market practices and is applicable to time of sale as well as retrofit measures. Retrofit measures may include new fixtures or relamp/reballast measures. In addition, options have been provided to allow for the "Reduced Wattage T8 lamps" or RWT8 lamps that result in re-lamping opportunities that produce equal or greater light levels than standard T8 lamps while using fewer watts.

This measure was developed to be applicable to the following program types: TOS, RF, and DI.

If applied to other program types, the measure savings should be verified.

The measure applies to all commercial HPT8 installations excluding new construction and major renovation or change of use measures (see lighting power density measure). Lookup tables have been provided to account for the different types of installations. Whenever possible, actual costs and hours of use should be utilized for savings calculations. Default new and baseline assumptions have been provided in the reference tables. Default component costs and lifetimes have been provided for O&M calculations. Please see the Definition Table to determine applicability for each program. HPT8 configurations not included in the TRM may be included in custom program design using the provided algorithms as long as energy savings is achieved. The following table defines the applicability for different programs

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
This measure relates to the installation of new equipment with efficiency that exceeds that of equipment that would have been installed following standard market practices. In general, the measure will include qualifying high- efficiency, low ballast-factor ballasts paired with high-efficiency, long- life lamps as detailed in the attached tables. High-bay applications use this system paired with qualifying high ballast factor ballasts and high performance 32 w lamps. Custom lighting designs can use qualifying low, normal or high ballast-factor ballasts and qualifying lamps in lumen equivalent applications where total system wattage is reduced when calculated using the calculation of savings algorithms.	This measure relates to the replacement of existing equipment with new equipment with efficiency that exceeds that of the existing equipment. In general, the retrofit will include qualifying high efficiency low-ballast factor ballasts paired with high efficiency long life lamps as detailed in the attached tables. Custom lighting designs can use qualifying low, normal or high-ballast factor ballasts and qualifying lamps in lumen equivalent applications where total system wattage is reduced when calculated using the calculation of savings algorithms. High-efficiency troffers (new/or retrofit) utilizing HPT8 technology can provide even greater savings. When used in a high-bay application, highperformance T8 fixtures can provide equal light to HID high-bay fixtures, while using fewer watts; these systems typically utilize high ballast-factor ballasts, but qualifying low and normal ballast factor ballasts may be used when appropriate light levels are provided and overall wattage is reduced.

# **DEFINITION OF EFFICIENT EQUIPMENT**

This characterization assumes the efficient condition for all applications are qualifying HP or RWT8 fixture and lamp/ballast combinations listed on the CEE website under qualifying HP T8 products<sup>184</sup> and qualifying RWT8 products.<sup>185</sup>

The definition of efficient equipment varies based on the program and is defined below:

	1 0
Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
High-efficiency troffers combined with high	High-efficiency troffers (new or retrofit kits)
	combined with high efficiency lamps and ballasts
1 0	allow for fewer lamps to be used to provide a given
	lumen output. High efficiency troffers must have a
fixture efficiency of 80% or greater to qualify.	fixture efficiency of 80% or greater to qualify.
High bay fixtures must have fixture efficiencies of 85% or greater.	High bay fixtures will have fixture efficiencies of 85% or greater.
	High-efficiency troffers combined with high efficiency lamps and ballasts allow for fewer lamps to be used to provide a given lumen output. High-efficiency troffers must have a fixture efficiency of 80% or greater to qualify. High bay fixtures must have fixture efficiencies

# **DEFINITION OF BASELINE EQUIPMENT**

The definition of baseline equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)		
The baseline is standard efficiency T8 systems that would have been installed. The baseline for high-bay fixtures is pulse start metal halide fixtures.	The baseline is the existing system. In July 14, 2012, federal standards were enacted that were expected to eliminate T12s as an option for linear fluorescent fixtures. However, due to significant loopholes in the legislation, T12 compliant product is still freely available. There will be a baseline shift applied to all T12 in 2020, at which point it is assumed no remaining		
	T12 products will remain in operation.		

 <sup>&</sup>lt;sup>184</sup> <u>http://library.cee1.org/content/cee-high-performance-t8-specification</u>
 <sup>185</sup> <u>http://library.cee1.org/content/reduced-wattage-t8-specification</u>

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed lifetime of efficient equipment varies based on the program and is defined below:

Time of Sale (TOS)	<b>Retrofit (RF) and Direct Install (DI)</b>
Fixture lifetime is 15 years. <sup>186</sup>	
Fixture retrofits which utilize RWT8 lamps have a lifetime equivalent to the life of the lamp, capped at 15 years. There is no guarantee that a reduced wattage lamp will be installed at time of burnout, but if one is, savings will be captured in the RWT8 measure below. RWT8 lifetime is the life of the product, at the reported operating hours (lamp life in hours divided by operating hours per year – see reference table "RWT8 Component Costs and Lifetime"), capped at 15 years. <sup>187</sup>	Fixture lifetime is 15 years. Note, since the fixture lifetime is deemed at 15 years, the replacement cost of both the lamp and ballast should be incorporated in to the O&M calculation.

#### **DEEMED MEASURE COST**

The deemed measure cost is found in the reference table at the end of this characterization.

#### LOADSHAPE

Lighting BUS

#### Algorithm

#### **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = ((Watts_{base} - Watts_{EE})/1000) * Hours * WHF_e * ISR$ 

Where:

Watts<sub>base</sub>

= Input wattage of the existing system which depends on the baseline fixture configuration (number and type of lamp) and number of fixtures. Value can be selected from the appropriate reference table as shown below, or a custom value can be entered if the configurations in the tables is not representative of the existing system.

Program	<b>Reference Table</b>		
Time of Sale	A-1: HPT8 and RWT8 New and		
Time of Sale	<b>Baseline Assumptions</b>		
Retrofit	A-2: HPT8 and RWT8 New and		
Keuont	Baseline Assumptions		

<sup>&</sup>lt;sup>186</sup> 15 years from GDS Measure Life Report, June 2007.

<sup>&</sup>lt;sup>187</sup> 15 years from GDS Measure Life Report, June 2007.

High-Bay T8 Time of Sale	A-3: High Bay T8 New and
and Retrofit	Baseline Assumptions

Watts <sub>EE</sub>	= New Input wattage of EE fixture which depends on new fixture configuration (number of lamps) and ballast factor and number of fixtures. Value can be selected
	from the appropriate reference table, or a custom value can be entered if the configurations in the tables is not representative of the existing system.
Hours	= Average hours of use per year as provided by the customer or selected from the
	Reference Table in Section 2.8. If hours or building type are unknown, use the
	C&I Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings from efficient
	lighting is selected from the Reference Table in Section 2.8 for each building type.
	If building is un-cooled, the value is 1.0.
ISR	= In Service Rate is assumed to be 100%
og Penalty	

Heating Penalty

If electrically heated building:

$$\Delta kWh_{heatpenalty}^{188} = (((WattsBase-WattsEE)/1000) * ISR * Hours * -IFkWh$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

#### Midlife Adjustment

A midlife savings adjustment should be applied to retrofit projects in 2020 to account for the baseline lamp replacement assumption changing from a T12 to 100% Standard T8 by 2020.<sup>189</sup> The savings adjustment is calculated as follows, and is provided in the HP/RW T8 Reference Table below:

$$Watts_{T8base} - Watts_{EE}$$
% Adjustment = (\_\_\_\_\_)  
Watts\_{Base} - Watts\_{EE}

Where:

Watts<br/>T8Base= Input wattage of the of a 100% T8 fixture baseline.Watts<br/>Base= Input wattage of the T12 baseline

- Input wattage of the 112 basen

<sup>&</sup>lt;sup>188</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>189</sup> As of July 1, 2010, a federal mandate states that the magnetic ballasts used in many T12 fixtures can no longer be produced for commercial and industrial applications. However, there have been many loopholes that have meant T12 lamps continue to hold a significant market share. It is expected that new mandates will close the loophole within the next few years. T12 lamps have an average life of 20,000 hours and if we assume they are operated on average for 4500 hours annually, this would mean a lamp would have to be replaced every 4.5 years. We therefore assume that by 2020 all replacement lamps are Standard T8s. Therefore, while the more likely scenario would be a gradual shift in baseline to T8s over the timeframe, to simplify this assumption, a single midlife adjustment in 2020 is assumed.

#### SUMMER COINCIDENT DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$  Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635

#### NATURAL GAS SAVINGS

 $\Delta$ Therms<sup>190</sup> = ((WattsBase-WattsEE)/1000) \* ISR \* Hours \*- IFTherms Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each building type.

#### WATER IMPACT DESCRIPTIONS AND CALCULATION

6-Lamp 28w RWT8 (BF < 0.77)	126.0	Standard T8	169.0	\$40.00

<sup>&</sup>lt;sup>190</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>191</sup> Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy Efficiency (CEE) Commercial Lighting Qualifying Product Lists. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline and efficient measure cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. See "HPT8 TRM Reference Tables.xlsx" for more information and specific product links. Currently, 25WT8 are not considered under this measure as their lower light trade off and limitations on temperature and dimming have caused most distributers/contractors to use 28W almost exclusively in other markets.

# 2.6.3 LED Bulbs and Fixtures

## DESCRIPTION

The installation of Light-Emitting Diode (LED) lighting systems have comparable luminosity to incandescent bulbs and equivalent fluorescent lamps at significantly less wattage, lower heat, and with significantly longer lifetimes.

This measure provides savings assumptions for a variety of efficient lighting fixtures including internal and external LED fixtures, recess (troffer), canopy, and pole fixtures as well as refrigerator and display case lighting.

This measure was developed to be applicable to the following program types: TOS and RF. If

applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, all LED fixtures are assumed to be ENERGY STAR<sup>®</sup> labeled or on the Design Light Consortium qualifying fixture list.<sup>192</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

For TOS and RF installations, the baselines efficiency case is project specific and is determined using actual fixture types and counts from the existing space. The existing fluorescent fixture end connectors and ballasts must be completely removed to qualify.

Where the installation technology is not known, the assumed baselines condition for an outdoor pole/arm, wall-mounted, garage/canopy fixture and high-bay luminaire with a high intensity discharge light source is a metal halide fixture. Deemed fixture wattages are provided in reference tables at the end of this characterization.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

Lifetime is the life of the product at the reported operating hours (lamp life in hours divided by operating hours per year – see reference table "LED component Costs and Lifetime." The analysis period is the same as the lifetime, capped at 15 years.<sup>193</sup>

#### **DEEMED MEASURE COST**

Actual incremental costs should be used if available. For default values, refer to the reference tables below.

# CALCULATION OF SAVINGS

### **ELECTRIC ENERGY SAVINGS**

$$h = \frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * WHFe * ISR$$

Where:

Watts <sub>Base</sub>	= Input wattage of the existing or baseline system. Reference the "LED New and Baseline Assumptions" table for default values.
Watts <sub>EE</sub>	= Actual wattage of LED fixture purchased / installed. If unknown, use default provided in "LED New and Baseline Assumptions."
Hours	= Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6 by building type. If hours or building type are unknown, use the C&I Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Lighting Reference Table in Section 2.6 for each building type. If building is un-cooled, the value is 1.0.
ISR	= In Service Rate is assumed to be 98.7% for Time of Sale and 100% for Retrofit. <sup>194</sup>
o Penalty	

### Heating Penalty:

If electrically heated building:

$$\frac{Watts_{Base} - Watts_{EE}}{\Delta kWhheatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts;<sup>195</sup> this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

## Mid Life Adjustment:

A midlife savings adjustment should be applied to any retrofit measure using a T12 baseline. The adjustment should occur in 2020 to account for the baseline lamp replacement assumption changing from a T12 to 100% Standard T8 by 2020. The savings adjustment is calculated as follows:

Where:

WattsT8 Base	= Input wattage of the existing system based on 100% T8 fixture.
WattsT12 Base	= Input wattage of the existing T12 system.

<sup>&</sup>lt;sup>194</sup> Based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015 and consistent with other program ISR in neighboring states (Illinois and Iowa).

<sup>&</sup>lt;sup>195</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

# SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta k = \Delta kWh * CF$$
 Where:

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0001899635 for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for 24/7 lighting

# NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):

 $\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFTherms)$ 

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts.<sup>196</sup> This factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

# WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

<sup>&</sup>lt;sup>196</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

# DEEMED O&M COST ADJUSTMENT CALCULATION

See Reference Tables below for default assumptions.

#### **REFERENCE TABLES<sup>197</sup>**

#### LED New and Baseline Assumptions:

LED Category	EE Measure		Baseline		Incremental
LLD Category	Description	Wattsee	Description	Wattsbase	Cost

<sup>&</sup>lt;sup>197</sup> Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy Efficiency (CEE) Commercial Lighting Qualifying Product Lists alongside past Efficiency Vermont projects and PGE refrigerated case study. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. Efficient cost data comes from 2012 DOE "Energy Savings Potential of Solid-State Lighting in General Illumination Applications," Table A.1. See "LED Lighting Systems TRM Reference Tables.xlsx" for more information and specific product links.

**MEASURE CODE:** 

# 2.6.4 LED Screw Based Omnidirectional Bulb

#### DESCRIPTION

LEDs lighting systems convert electricity to light and emit more lumens per watt when compared to baseline EISA incandescent, halogen, or compact fluorescent lamps.

This specific characterization provides savings assumptions for LED lamps that replace standard screw-in connections (e.g., A-Type lamp) such as interior/exterior omnidirectional bulb options.

This characterization assumes that the LED is installed in a commercial location. This is, therefore, appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the residential versus nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W in 2013 and 60W and 40W in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

This measure was developed to be applicable to the following program types: TOS and RF. If

applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, new LED screw-based lamps must be ENERGY STAR<sup>®</sup> qualified based upon the ENERGY STAR<sup>®</sup> specification v2.0 which will become effective on 1/2/2017 (<u>https://www.energystar.gov/sites/default/files/Luminaires%20V2%200%20Final.pdf</u>). Qualification could also be based or on the Design Light Consortium's qualified product list.<sup>198</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent. From 2020 the baseline will begin transitioning to a CFL<sup>199</sup> based upon what is available in the market and therefore a midlife adjustment is provided.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of the product is the lamp life in hours divided by operating hours per year. Depending on operating conditions (currents and temperatures) and other factors (settings and building use), LED rated life is assumed to be 50,000 hours.<sup>200</sup>

<sup>&</sup>lt;sup>198</sup> <u>https://www.designlights.org/QPL</u>

<sup>&</sup>lt;sup>199</sup> A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL.

<sup>&</sup>lt;sup>200</sup> LED Fixture Component Costs & Lifetime Table found on page 372 of the IL TRM v6.0 Volume 2.

# **DEEMED MEASURE COST**

Wherever possible, actual incremental costs should be used. If unavailable, assume 3.26 (baseline cost of 1.80 and efficient cost of 5.06).<sup>201</sup>

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * WHFe * ISR$$

Where:

Watts<sub>Base</sub> = Based on lumens of LED bulb installed

Watts<sub>EE</sub>

= Actual wattage of LED purchased/installed. If unknown, use default

provided below.<sup>202</sup>

Lower Lumen Range	Upper Lumen Range	Watts <sub>Base</sub>	Watts <sub>EE</sub> LED	Delta Watts
250	309	25	4.0	21
310	749	29	6.7	22.3
750	1,049	43	10.1	32.9
1,050	1,489	53	12.8	40.2
1,490	2,600	72	17.4	54.6
2,601	3,000	150	43.1	106.9
3,001	3,999	200	53.8	146.2
4,000	6,000	300	76.9	223.1

<sup>&</sup>lt;sup>201</sup> Incandescent/halogen and LED cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016

<sup>(</sup>http://ma-eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study\_FINAL\_01FEB2016.pdf), p.19. <sup>202</sup> Watts<sub>EE</sub> defaults are based upon the average available ENERGY STAR<sup>®</sup> product, accessed 06/18/2015. For any lumen range where there is no ENERGY STAR<sup>®</sup> product currently available, Watts<sub>EE</sub> is based upon the ENERGY STAR<sup>®</sup> minimum luminous efficacy (55Lm/W for lamps with rated wattages less than 15W and 65 Lm/W for lamps with rated wattages  $\geq$  15 watts) for the mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx." These assumptions should be reviewed regularly to ensure they represent the available product.

Hours	= Average hours of use per year as provided by the customer or selected
	from the Lighting Reference Table in Section 2.6 and based upon building
	type. If unknown, use the C&I Average value.
WHFe	= Waste heat factors for energy to account for cooling energy savings from
	efficient lighting are provided for each building type in the Lighting
	Reference Table in Section 2.6. If unknown, use the C&I Average value.
ISR	= In-Service Rate or the percentage of units rebated that get installed
=	98.7% 203

# Mid-Life Baseline Adjustment

During the lifetime of a standard omnidirectional LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. Since the baseline bulb changes to a CFL equivalent in 2020 due to the EISA backstop provision (except for <310 and 2600+ lumen lamps), the annual savings claim must be reduced within the life of the measure to account for this baseline shift. This reduced annual savings will need to be incorporated in to cost effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule.

For example, for 43W equivalent LED lamp installed in 2016, the full savings (as calculated above in the Algorithm) should be claimed for the first four years, but a reduced annual savings (calculated energy savings above multiplied by the adjustment factor in the table below) should be claimed for the remainder of the measure life.<sup>204&205</sup>

<sup>&</sup>lt;sup>203</sup> Based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. This value takes into account the time-delay of when bulbs are installed over subsequent program years. The reported ISR is based on the net present value (NPV) of the savings over 4 year installation period from the PY15 bulbs, discounted back to Year 1 at 6.95% (utility discount rate).

<sup>&</sup>lt;sup>204</sup> These adjustments should be applied to kW and gas impacts as well.

<sup>&</sup>lt;sup>205</sup> Calculated with EISA requirement of 45lumens/watt.

Lower Lumen Range	Upper Lumen Range	Mid Lumen Range	Watts EE	WattsBase before EISA 2020	Delta Watts before EISA 2020	WattsBase after EISA 2020 <sup>208</sup>	Delta Watts after EISA 2020	Mid Life adjustment (in 2020) to first year savings
250	309	280	4.0	25	21	25	21	100.0%
310	749	530	6.7	29	22.3	9.4	2.7	12.1%
750	1049	900	10.1	43	32.9	13.4	3.3	10.0%
1050	1489	1270	12.8	53	40.2	18.9	6.1	15.2%
1490	2600	2045	17.4	72	54.6	24.8	7.4	13.6%
2,550	3,000	2,775	43.1	150	106.9	150	106.9	100.0%
3,001	3,999	3,500	53.8	200	146.2	200	146.2	100.0%
4,000	6,000	5,000	76.9	300	223.1	300	223.1	100.0%

# Heating Penalty:

If electrically heated building:<sup>206</sup>

$$\Delta kWhheatpenalty = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.

# SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta k = \Delta kWh * CF$$
 Where:

CF

= 0.0001899635 for indoor lighting

- = 0.0000056160 for exterior lighting
- = 0.0001379439 for 24/7 lighting

# NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown): 207

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFTherms)$$

Where:

<sup>&</sup>lt;sup>206</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>207</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.

### WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

#### DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the falling EISA-Qualified backdrop provision, an equivalent annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. The key assumptions used in this calculation are documented below:<sup>208</sup>

Incandescent / Halogen	CFL	LED ALamp
\$1.80	\$2.20	\$5.06

The present value of replacement lamps and annual levelized replacement costs using utilities' average real discount rate of 6.91% are presented below:

Teastian	PV of rej	placement period	costs for	Levelized annual replacement cost savings			
Location	2016 - 2017	2017 - 2018	2018 - 2019	2016 - 2017	2017 - 2018	2018 - 2019	
C&I Average	\$18.66	\$14.70	\$10.46	\$2.04	\$1.60	\$1.14	

<sup>&</sup>lt;sup>208</sup> All cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016 (http://mahttp://ma-eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study\_FINAL\_01FEB2016.pdfeeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study\_FINAL\_01FEB2016.pdf), p.19.

Note: incandescent lamps in lumen range <310 and >2600 are exempt from EISA. For these bulb types, an O&M cost should be applied as follows. If unknown building type, assume C&I Average:

Building Type	Replacement Period (years) <sup>209</sup>	Replacement Cost
Large Office	0.32	
Medium Office	0.32	
Small Office	0.35	
Warehouse	0.35	
Stand-alone Retail	0.29	
Strip Mall	0.27	
Primary School	0.29	
Secondary School	0.29	
Supermarket	0.27	$$1.80^{210}$
Quick Service Restaurant	0.16	
Full Service Restaurant	0.16	
Hospital	0.26	
Outpatient Health Care	0.26	
Small Hotel - Building	0.27	
Large Hotel - Building	0.27	
Midrise Apartment - Building	0.35	
C&I Average	0.30	

MEASURE CODE:

<sup>&</sup>lt;sup>209</sup> Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA-qualified halogen/incandescent is 1000 hours (manufacturers are simply using a regular incandescent lamp with halogen fill gas rather Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC)).

<sup>&</sup>lt;sup>210</sup> Incandescent/halogen cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016 (http://ma-eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study\_FINAL\_01FEB2016.pdf), p.19.

# 2.6.5 T5 Fixtures and Lamps

# DESCRIPTION

T5 HO lamp/ballast systems have greater lumens per watt than a typical T8 system. The smaller lamp diameter of the T5HO also increases optical control efficiency and allows for more precise control and directional distribution of lighting. These characteristics make it easier to design light fixtures that can produce equal or greater light than standard T8 or T12 systems, while using fewer watts. In addition, when lighting designers specify T5 HO lamps/ballasts, they can use fewer luminaries per project, especially for large commercial projects, thus increasing energy savings further.<sup>211</sup>

The main markets served by T5 HO fixtures and lamps include retrofit in the commercial and nonresidential sector, specifically industrial, warehouse, and grocery facilities with higher ceiling heights that require maximum light output.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

The definition of the efficient equipment is T5 HO high-bay (>15ft mounting height) fixtures with 3, 4, 6, or 8-lamp configurations.

# **DEFINITION OF BASELINE EQUIPMENT**

The definition of baseline equipment varies based on number of lamps in a fixture and is defined in the baseline reference table at the end of this characterization. The default baseline is assumed to be a PulseStart Metal Halide fixture.

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed lifetime of the efficient equipment fixture is 15 years.<sup>212</sup>

#### **DEEMED MEASURE COST**

The deemed measure cost is found in Reference Table at the end of this characterization. For retrofit applications, actual costs should be used if available, or, if not available, \$10/lamp and \$37.50/ballast can be used to account for installation labor costs.

<sup>&</sup>lt;sup>212</sup> Focus on Energy Evaluation "Business Programs: Measure Life Study" Final Report, August 9, 2009, prepared by PA Consulting Group.

#### **ELECTRIC ENERGY SAVINGS**

	WattsBase – WattsEE	
$\Delta kW^{h} =$	1,000	* Hours * WHFe * ISR

Where:

Watts <sub>Base</sub>	= Custom input. If unknown, input wattage of the baseline system is dependent on new fixture configuration and found in the 'T5HO Efficient and Baseline Wattage and Cost Assumptions' reference table below.
Watts <sub>EE</sub>	= Custom Input. If unknown, input wattage depends on new fixture configuration (number of lamps) and ballast factor and number of fixtures. Value can be selected from the 'T5HO Efficient and Baseline Wattage and Cost Assumptions' reference table below.
Hours	= Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6 as annual operating hours, by building type. If hours or building type are unknown, use the C&I Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Lighting Reference Table in Section 2.6 for each building type. If building is un-cooled, the value is 1.0.
ISR	= In Service Rate or the percentage of units rebated that get installed. = $98\%$ . <sup>213</sup> <u>Heating</u>

Penalty:

If electrically heated building:<sup>217</sup>

$$\Delta kW hheat penalty = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

# SUMMER COINCIDENT DEMAND SAVINGS

$$\Delta k = \Delta kWh * CF$$
 Where:

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0001899635 for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for 24/7 lighting

# NATURAL GAS ENERGY SAVINGS

<sup>&</sup>lt;sup>213</sup> Based upon review of PY5-6 evaluations from ComEd, IL commercial lighting program (BILD). <sup>217</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFTherms)$$

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6.<sup>214</sup> If unknown, use the C&I Average value.

# DEEMED O&M COST ADJUSTMENT CALCULATION

See reference tables for different cost assumptions for lamps and ballasts. When available, actual costs and hours of use should be used.

8-Lamp T5 High-Bay	30,000	\$168.00	70,000	\$137.50	20,000	\$78.00	40,000	\$137.50

# **MEASURE CODE:**

<sup>&</sup>lt;sup>214</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>215</sup> Reference Table adapted from Efficiency Vermont TRM, T5 Measure Savings Algorithms and Cost Assumptions, October,

<sup>&</sup>lt;sup>216</sup> Refer to "T5HO-adjusted deemed costs.baselines.xlsx" for more information.

<sup>&</sup>lt;sup>217</sup> Costs include labor cost – see "T5HO-adjusted deemed costs.baselines.xlsx" for more information.

# 2.6.6 LED Exit Sign

This measure characterizes the savings associated with installing a new LED exit sign (or retrofit kit) in place of a CFL or incandescent exit sign in a commercial building. LED exit signs use less power ( $\leq 5$  watts), have a significantly longer lifetime, and have less maintenance costs when compared to incandescent or CFL exit signs.<sup>218</sup>

This measure applies to the following program types: RF and DI.

# **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is an LED exit sign with an input power demand of 5 watts or less.<sup>219</sup>

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is the existing exit sign (either a CFL or incandescent unit).

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 16 years.<sup>220</sup>

# **DEEMED MEASURE COST**

Actual program delivery costs should be used if available. If not, use the full cost of \$39<sup>221</sup> for a new LED exit sign and \$25 for a retrofit kit, plus \$6.25 in labor,<sup>222</sup> for a total measure cost of \$45.25 and \$31.25, respectively.

#### CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS 223

 $\Delta kW h = \frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * WHFe$ 

<sup>&</sup>lt;sup>218</sup> ENERGY STAR<sup>®</sup> "Save Energy, Money and Prevent Pollution with LED Exit Signs."

<sup>&</sup>lt;sup>219</sup> ENERGY STAR <sup>®</sup> "Program Requirements for Exit Signs Version 3.0." While the EPA suspended the ENERGY STAR<sup>®</sup> Exit Sign specification effective May 1, 2008, Federal requirements specify minimum efficiency standards for electrically-powered, single-faced exit signs with integral lighting sources that are equivalent to ENERGY STAR<sup>®</sup> levels for input power demand of 5 watts or less per face.

<sup>&</sup>lt;sup>220</sup> California Database for Energy Efficiency Resources (DEER) 2014 Estimated Useful Life (EUL) Table Update.

<sup>&</sup>lt;sup>221</sup> Cost of new LED exit sign from ENERGY STAR<sup>®</sup> Exit Signs Calculator.xlsx.

<sup>&</sup>lt;sup>222</sup> Assumption based on 15 minutes (including portion of travel time) and \$25 per hour, which is in line with the typical prevailing wage of a General Laborer, as per the Annual Wage Order No. 23 published by the Missouri Department of Labor.

<sup>&</sup>lt;sup>223</sup> There is no ISR calculation. Exit signs and emergency lighting are required by federal regulations to be installed and functional in all public buildings as outlined by the U.S. Occupational Safety and Health Standards (USOSHA 1993).

Where:

Watts<sub>Base</sub>

= Actual wattage if known, if unknown assume the following:

Baseline Type	Watts <sub>Base</sub>
Incandescent (dual sided)	$50W^{224}$
Incandescent (single sided)	25W
CFL (dual sided)	$14W^{225}$
CFL (single sided)	7W

Watts <sub>EE</sub>	= Actual wattage if known; if unknown assume 2W for singled sided and $4W$ . <sup>226</sup> for dual sided
Hours	= Annual operating hours
	= 8,766
WHF <sub>e</sub>	= Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Lighting Reference Table in Section 2.6 for each building type. If building is un-cooled, the value is 1.0.

# HEATING PENALTY

If electrically heated building:

$$\Delta kWh_{heatpenalty}^{227} = \frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

Other factors as defined above.

# SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * CF$$

Where:

∆kWh = Electric energy savings, including cooling savings, as calculated above.

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor

----

<sup>&</sup>lt;sup>224</sup> Average incandescent single sided (5W, 10W, 15W, 20W, 25W, 34W, 40W, 50W) from Appendix B 2013-14 Table of Standard Fixture Wattages. Available at:

http://www.aescinc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf 225 Average CFL single sided (5W, 7W, 9W) from Appendix B 2013-14 Table of Standard Fixture Wattages. Available at: http://www.aesc-inc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf

<sup>&</sup>lt;sup>226</sup> Average Exit LED watts are assumed as a 2W as listed in Appendix B 2013-14 Table of Standard Fixture Wattages. Available at: http://www.aesc-inc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf

<sup>&</sup>lt;sup>227</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

= 0.0001379439 Other

factors as defined above.

# NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating is unknown):<sup>228</sup>

$$\frac{Watts_{Base} - Watts_{EE}}{\Delta Therms} = \frac{Watts_{EE}}{1,000} * Hours * (-IFTh_{erms})$$

Where:

IFTherms = Lighting-HVAC Integration Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each building type.

Other factors as defined above.

#### WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

## DEEMED O&M COST ADJUSTMENT CALCULATION

The annual O&M cost adjustment savings should be calculated using the following component costs and lifetimes.

Component	Baseline Measure			
	Cost <sup>229</sup>	Life (yrs) <sup>230</sup>		
CFL lamp	\$8.91	0.63 years		
Incandescent lamp	\$7.39	0.14 years		

**MEASURE CODE:** 

<sup>&</sup>lt;sup>228</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>229</sup> Includes cost of labor and new replacement bulb. Labor cost of \$6.25 based on 15 minutes (including portion of travel time) and \$25 per hour, which is in line with the typical prevailing wage of a General Laborer, as per the Annual Wage Order No. 23 published by the Missouri Department of Labor. Cost of new 7W CFL bulb is \$2.66, from Itron "2010-2012 WO017 Ex Ante Measure Cost Study Final Report." Prepared for California Public Utilities Commission, May 27, 2014.

<sup>&</sup>lt;sup>230</sup> ENERGY STAR<sup>®</sup> "Save Energy, Money and Prevent Pollution with LED Exit Signs" states that CFL bulbs for exit signs typically have an average rated life of 5,000-6,000 hours. Given 24/7 run time, assume a CFL in an exit sign will require replacement every 0.63 years (5,500 hours/8,766 hours).

# 2.6.7 LED Specialty Lamp

# DESCRIPTION

This characterization provides savings assumptions for LED directional, decorative, and globe lamps. This characterization assumes that the LED is installed in a commercial location. This is therefore appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the EISA requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL.

This measure was developed to be applicable to the following program types: TOS and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, new lamps must be ENERGY STAR<sup>®</sup> labeled based upon the ENERGY STAR<sup>®</sup> specification v2.0 which will become effective on1/2/2017.<u>https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2\_0%20</u> <u>Revised%20AUG-2016.pdf</u>). Qualification could also be based on the Design Light Consortium's qualified product list.<sup>231</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent. From 2020 the baseline will begin transitioning to a CFL based upon what is available in the market.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of the product is the lamp life in hours divided by operating hours per year. Depending on operating conditions (currents and temperatures) and other factors (settings and building use), LED rated life is assumed to be 50,000 hours.<sup>232</sup>

#### **Deemed Measure Cost**

Wherever possible, actual incremental costs should be used. If unavailable, assume the following incremental costs:<sup>233</sup>

<sup>&</sup>lt;sup>231</sup> <u>https://www.designlights.org/QPL</u>

<sup>&</sup>lt;sup>232</sup> LED Fixture Component Costs & Lifetime Table found on page 372 of the IL TRM v6.0 Volume 2.

<sup>&</sup>lt;sup>233</sup> Incandescent based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014. LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail cost was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications," Table A.1) used to decrease the cost for a 2017 TRM assumption (see 2015 LED Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle.

Bulb Type	LED Wattage	LED	Incandesce nt	Incremental Cost
Directional	< 20W	\$14.52	\$6.31	\$8.21
Directional	≥20W	\$45.85	φ <b>0.</b> 51	\$39.54
	<15W	\$8.09		\$4.17
Decorative	15 to <25W	\$15.86	\$3.92	\$11.94
	≥25W	\$15.86		\$11.94

#### CALCULATION OF SAVINGS

# **ELECTRIC ENERGY SAVINGS**

 $h = \frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * WHFe * ISR$ 

Where:

Watts<sub>Base</sub>

= Based on bulb type and lumens of LED bulb installed. See table below.

provide	Lower	Upper			
Bulb Type	Lower Lumen Range	Lumen Range	Watts <sub>Base</sub>	Watts <sub>EE</sub>	Delta Watts
	250	349	25	5.6	19.4
	350	399	35	6.3	28.7
Dimentional	400	599	40	7.5	32.5
Directional	600	749	60	9.7	50.3
	750	999	75	12.7	62.3
	1000	1250	100	16.2	83.8
	70	89	10	1.8	8.2
Decorative	90	149	15	2.7	12.3
	150	299	25	3.2	21.8
	300	499	40	4.7	35.3
	500	699	60	6.9	53.1
	250	349	25	4.1	20.9
	350	499	40	5.9	34.1
Globe	500	574	60	7.6	52.4
	575	649	75	13.6	61.4
	650	1099	100	17.5	82.5
	1100	1300	150	13.0	137.0

Watts<sub>EE</sub> = Actual wattage of LED purchased / installed - If unknown, use default provided below:<sup>234</sup>

Hours	= Average hours of use per year as provided by the customer or selected from the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.
WHFe	= Waste heat factors for energy to account for cooling energy savings from efficient lighting are provided for each building type in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.
ISR	= In Service Rate or the percentage of units rebated that get installed
Heating Penalty:	$= 98.7\%^{235}$

<sup>&</sup>lt;sup>234</sup> Watts<sub>EE</sub> defaults are based upon the average available ENERGY STAR<sup>®</sup> product, accessed 06/18/2015. For any lumen range where there is no ENERGY STAR<sup>®</sup> product currently available, Watts<sub>EE</sub> is based upon the ENERGY STAR<sup>®</sup> minimum luminous efficacy (55Lm/W for lamps with rated wattages less than 15W and 65 Lm/W for lamps with rated wattages  $\geq$  15 watts) for the mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx." These assumptions should be reviewed regularly to ensure they represent the available product.

<sup>&</sup>lt;sup>235</sup> Based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. This value takes into account the time-delay of when bulbs are installed over subsequent program years. The reported ISR is based on the net present value (NPV) of the savings over 4 year installation period from the PY15 bulbs, discounted back to Year 1 at 6.95% (utility discount rate).

If electrically heated building:<sup>236</sup>

$$\Delta kWhheatpenalty = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * CF$$

# Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0001899635 for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for 24/7 lighting

for measure is provided in the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.

Other factors as defined above.

#### NATURAL GAS SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):<sup>237</sup>

 $\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFTherms)$ 

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon building type. If unknown, use the C&I Average value.

<sup>&</sup>lt;sup>236</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>237</sup> Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

# DEEMED O&M COST ADJUSTMENT CALCULATION

O&M cost should be applied as follows:

Installation Location	Replacement Period (years) <sup>238</sup>	Replacement Cost <sup>239</sup>
Large Office	0.32	
Medium Office	0.32	
Small Office	0.35	
Warehouse	0.35	
Stand-alone Retail	0.29	
Strip Mall	0.27	
Primary School	0.29	Decorative:
Secondary School	0.29	\$6.31
Supermarket	0.27	
Quick Service Restaurant	0.16	Directional:
Full Service Restaurant	0.16	\$3.92
Hospital	0.26	
Outpatient Health Care	0.26	
Small Hotel - Building	0.27	
Large Hotel - Building	0.27	
Midrise Apartment - Building	0.35	
C&I Average	0.30	

<sup>&</sup>lt;sup>238</sup> Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA qualified Halogen/ Incandescent is 1000 hours. The manufacturers are simply using a regular incandescent lamp with halogen fill gas rather than Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC).
<sup>239</sup> Incandescent costs based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014.

# 2.6.8 Lighting Power Density

#### DESCRIPTION

This measure entails the installation of efficient lighting systems in either new construction or during substantial renovation of commercial buildings that triggers compliance with code. This methodology applies to situations where code specifies maximum lighting power density allowances (W/ft<sup>2</sup>). Either the Building Area Method or Space by Space (not recognized by IECC 2009) method as defined in IECC 2009, 2012 or 2015, can be used for calculating the Interior Lighting Power Density.<sup>240</sup> The measure consists of a design that is more efficient (has a lower lighting power density in watts/square foot) than code requires.

This measure was developed to be applicable to the following program type: NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the lighting system must be more efficient than the baseline energy code lighting power density in watts/square foot for either the interior space or exterior space.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline is assumed to be a lighting power density that meets the building code recognized by the local jurisdiction. For illustrative purposes in this characterization, IECC 2009, 2012 and 2015, are highlighted to demonstrate the methodology.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>241</sup>

#### **DEEMED MEASURE COST**

The actual incremental cost over a baseline system should be collected from the customer if possible, or quantified using an alternative suitable source.

#### LOADSHAPE

Lighting BUS

Ext Lighting BUS

Algorithm

#### CALCULATION OF SAVINGS

**ENERGY SAVINGS** 

<sup>&</sup>lt;sup>240</sup> Refer to the referenced code documents for specifics on calculating lighting power density using either the whole building method (IECC) or the Space by Space method (ASHRAE 90.1).

<sup>&</sup>lt;sup>241</sup> Measure Life Report, Residential and Commercial/Industrial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007.

$$\Delta kWh = (WSF_{base}-WSF_{effic})/1000*SF*Hours*WHF_{e}$$

Where:

$WSF_{base}$ $WSF_{effic}$	<ul> <li>Baseline lighting watts per square foot or linear foot as determined by building or space type. IECC example whole building analysis values are presented in the Reference Tables below.<sup>242</sup></li> <li>The actual installed lighting watts per square foot or linear foot.</li> </ul>
SF	= Provided by customer based on square footage of the building area applicable to the lighting design for new building.
Hours	= Annual site-specific hours of operation of the lighting equipment collected from the customer or selected from the Reference Table in Section 2.8 if unavailable.
WHF <sub>e</sub>	= Waste Heat Factor for Energy to account for cooling savings from efficient lighting is as provided in the Reference Table in Section 2.8 for each building type. If building is not cooled, the value is 1.0.

#### Heating Penalty

If electrically heated building:

 $\Delta kWh_{heatpenalty^{243}} = (WSF_{base}-WSF_{effic})/1000*SF*Hours*-IFkWh$  Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$  Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor =

0.0001899635 for indoor lighting

- = 0.0000056160 for exterior lighting
- = 0.0001379439 for 24/7 lighting

Other factors as defined above

# NATURAL GAS ENERGY SAVINGS

 $\Delta$ Therms = (WSF<sub>base</sub>-WSF<sub>effic</sub>)/1000\* SF\* Hours \* - IFTherms Where:

IFTherms = Lighting-HVAC Integration Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each building type.

<sup>&</sup>lt;sup>242</sup> See IECC 2009, 2012 and 2015 - Reference Code documentation for additional information.

<sup>&</sup>lt;sup>243</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

#### TABLE C405.4.2(2)—continued INTERIOR LIGHTING POWER ALLOWANCES: SPACE-BY-SPACE METHOD

a. In cases where both a common space type and a building area specific space type are listed, the building area specific space type shall apply

b. A 'Facility for the Visually Impaired' is a facility that is licensed or will be licensed by local or state authorities for senior long-term care, adult daycare, senior support or people with special visual needs. The exterior lighting design will be based on the building location and the applicable "Lighting Zone" as defined in

IECC 2015 Table C405.5.2(1) which follows. This table is identical to IECC 2012 Table C405.6.2(1) and IECC 2009 Table 505.6.2(1).

LIGHTING ZONE	DESCRIPTION
1	Developed areas of national parks, state parks, forest land, and rural areas
2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use and residential mixed-use areas
3	All other areas not classified as lighting zone 1, 2 or 4
4	High-activity commercial districts in major metropoli- tan areas as designated by the local land use planning authority

# TABLE C405.5.2(1) EXTERIOR LIGHTING ZONES

The lighting power density savings will be based on reductions below the allowable design levels as specified in IECC 2009 Table 505.6.2(2), IECC 2012 Table C405.6.2(2) or IECC 2015 Table C405.5.2(2).

# 2.6.9 Metal Halide Fixtures and Lamps

# DESCRIPTION

This measure involves the installation of high efficiency pulse start metal halide fixtures and lamps in place of a standard metal halide. Pulse start metal halide luminaires produce more lumens per watt and have an improved lumen maintenance compared to standard probe start technology. Similarly, the high efficiency pulse start metal halide ballast lasts longer than a standard system due to their cooler operating temperatures.<sup>246</sup>

This measure was developed to be applicable for the following program type: RF.

# **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition is an EISA-compliant pulse start metal halide lamp and ballasts for luminaires. Under 2009 federal rulings metal halide ballasts in low-watt options (150W-500W fixtures) must be pulse start and have a minimum ballast efficiency of 88%.<sup>247</sup> Amendments made in 2014 require more stringent energy conservations standards with compliance required by February 10, 2017.<sup>248</sup>

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is the existing bulb and fixture. If unknown assume, High Intensity Discharge (HID) Metal Halide lighting with probe start fixture and a standard  $\leq 400$  Watt lamp.

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 15 years.<sup>249</sup>

# DEEMED MEASURE COST

As a retrofit measure, actual costs should be used. If unknown, cost is assumed to be \$267.

<sup>&</sup>lt;sup>246</sup> Building a Brighter Future: Your Guide to EISA-Compliant Ballast and Lamp Solutions from Philips Lighting: <u>http://1000bulbs.com/pdf/advance%20eisa%20brochure.pdf</u>

<sup>&</sup>lt;sup>247</sup> Under EISA rulings, metal halide ballasts in low-watt options must be pulse start and have a minimum ballast efficiency of 88%. This ruling virtually eliminates the manufacture of probe start (ceramic) fixtures but some exemptions exist including significantly the 150w wet location fixtures (as rated per NEC 2002, section 410.4 (A)). These will be replaced by 150W. Department of Energy – 10 CFR Part 431 – Energy Conservation Program: Energy Conservation Standards for Metal Halide Lamp Fixtures; Final Rule 7746 Federal Register / Vol. 79, No. 27 / Monday, February 10, 2014 / Rules and Regulations <u>https://www.federalregister.gov/articles/2014/02/10/2014-02356/energy-conservation-program-energy-conservation-standardsformetal-halide-lamp-fixtures#h-9</u>

<sup>&</sup>lt;sup>248</sup> The revised 2014 efficiency standards for metal halides require that luminaires produced on or after February 10, 2017, must not contain a probe-start metal halide ballast. Exceptions to this ruling include, metal halide luminaires with a regulated-lag ballast that utilize an electronic ballasts which operates at 480V and those which utilize a high-frequency (≥1000Hz) electronic ballast. Department of Energy – 10 CFR Part 431 – Energy Conservation Program: Energy Conservation Standards for Metal Halide Lamp Fixtures; Final Rule 7746 Federal Register / Vol. 79, No. 27 / Monday, February 10, 2014 / Rules and Regulations https://www.federalregister.gov/articles/2014/02/10/2014-02356/energy-conservation-program-energy-conservation-standardsformetal-halide-lamp-fixtures#h-9

# Algorithm

# CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

_	WattsBase – V	Vattsee ∆kWh
	1,000	* Hours * WHFe * ISR

Where:

Watts <sub>Base</sub>	= Input wattage of the existing system which depends on the baseline fixture configuration (number and type of lamp). Value can be selected from the reference table at the end of the characterization or a custom value can be used.
Watts <sub>EE</sub>	= New Input wattage of EE fixture, which depends on new fixture configuration. Value can be selected from the appropriate reference table at the end of the characterization, or a custom value can be used.
Hours	= Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6. If hours or building type are unknown, use the C&I Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Reference Table in Section 2.8 for each building type. If building is un-cooled, the value is 1.0.
ISR	= In Service Rate is assumed to be 100%

Heating Penalty:

If electrically heated building:

 $256 = \frac{WattsBase - WattsEE \Delta kWh_{heatpenalty}}{ISR * Hours * (-IFkWh)}$ 

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

# SUMMER COINCIDENT DEMAND SAVINGS

$$\begin{array}{ll} \Delta kW = \Delta kWh * CF \mbox{ Where:} \\ \Delta kWh & = \mbox{ as calculated above.} \\ CF & = \mbox{ Summer peak coincidence demand (kW) to annual energy (kWh) factor} \\ & = \mbox{ 0.0001899635 for indoor lighting} \\ & = \mbox{ 0.000056160 for exterior lighting} \end{array}$$

= 0.0001379439 for 24/7 lighting

# NATURAL GAS SAVINGS

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (-IFTherms)^{250}$$

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each building type.

#### **REFERENCE TABLES**<sup>252&253</sup>

<sup>&</sup>lt;sup>250</sup> Negative value because this is an increase in heating consumption due to the efficient lighting

<sup>&</sup>lt;sup>251</sup> Given that probe start MH technology is becoming a technology of the past, it is assumed that upon failure they would have been replaced with pulse start technology.

<sup>&</sup>lt;sup>252</sup> Per lamp/ballast.

<sup>&</sup>lt;sup>253</sup> Standard Magnetic Core and Coil ballast systems are common for Metal Halide lamp wattages 175-400. See Panasonic "Metal Halide: Probe Start vs. Pulse Start."

# 2.6.10 Occupancy Lighting Sensor Controls

# DESCRIPTION

Occupancy sensors are devices that reduce lighting levels by turning lights on or off in response to the presence (or absence) of people in a defined area. Associated energy savings depends on the building type, location area covered, type of lighting and activity, and occupancy pattern.<sup>254</sup>

This measure relates to the installation of interior occupancy sensors on new fixtures in an existing lighting system. Lighting control types covered by this measure include remote-mounted and fixture mounted. It does not cover automatic photo sensors, time clocks, and energy management systems. All sensors must be hard wired and control interior lighting.

This measure was developed to be applicable to the following program types: TOS and RF.

If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

It is assumed that this measure characterization applies to only fixture-mounted occupancy sensors and remote mounted occupancy sensors.

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline efficiency case assumes lighting fixtures with no occupancy controls.

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for all lighting controls is assumed to be 10 years.<sup>255</sup>

# DEEMED MEASURE COST

When available, the actual cost of the measure shall be used. When not available, the following default values are provided:

Lighting control type	Cost <sup>256</sup>
Full cost of fixture mounted occupancy sensor	\$45
Full cost of remote (ceiling) mounted occupancy sensor	\$105

#### CALCULATION OF SAVINGS

**ELECTRIC ENERGY SAVINGS** 

 $\Delta kWh = kW_{Controlled} * Hours * ESF * WHFe$ 

<sup>&</sup>lt;sup>254</sup> United States Department of the Interior. Greening the Department of Interior. http://www.doi.gov/archive/greening/energy/occupy.html

<sup>&</sup>lt;sup>255</sup> Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007. <sup>263</sup>

<sup>&</sup>lt;sup>256</sup> Based on averaging typical prices quoted by online vendors.

Where:

kW<sub>Controlled</sub> = Total lighting load connected to the control in kilowatts. Savings is per control. The total connected load per control should be collected from the customer, or use the default values presented below used;

default values presented below use	,
Lighting Control Type Interior	Default kW controlled <sup>257</sup>
Fixture-mounted occupancy sensor	0.138 (per fixture)
Remote (ceiling) mounted occupancy	0.338 (per control)
sensor	0.338 (per control)

- Hours = The total annual operating hours of lighting for each type of building before occupancy sensors. This number should be collected from the customer. If no data is available, the deemed average number of operating hours by building type should be used as provided by Lighting Reference Table in Section 2.6. If building type is unknown, use the C&I Average value.
- ESF = Energy Savings factor (represents the percentage reduction to the operating Hours from the non-controlled baseline lighting system). Determined on a site specific basis or using the default values below:

Lighting Control Type	Energy Savings Factor <sup>258</sup>
Fixture-mounted sensor	24%
Remote (ceiling) mounted occupancy sensor	24%

 $WHF_e = Waste heat factor for energy to account for cooling energy savings from more efficient lighting is provided in the Lighting Reference Table in Section 2.6.$ 

Heating Penalty:

If electrically heated building:<sup>259</sup>

$$\Delta kWh_{heatpenalty} = kW_{Controlled} * Hours * ESF * (-IFkWh)$$

Where:

IFkWh = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table 2.6.

<sup>259</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>&</sup>lt;sup>257</sup>Efficiency Vermont Technical Reference Manual 12.31.2018, Page 47;

https://puc.vermont.gov/sites/psbnew/files/doc\_library/Vermont%20TRM%20Savings%20Verification%202018%20Version\_FIN AL.pdf

<sup>&</sup>lt;sup>258</sup> Lawrence Berkeley National Laboratory. A Meta-Analysis of Energy Savings from Lighting Controls in Commercial Buildings. Page & Associates Inc. 2011.

http://eetd.lbl.gov/publications/meta-analysis-energy-savings-lighting-controls-commercial-buildings.

LBNL's meta study of energy savings from lighting controls in commercial buildings bases its savings analysis on over 240 actual field installations. The report found that savings are over-represented and do not filter for external factors such as building orientation, location, use, weather, blinds, commissioning, changes in behavior after controls are set, etc. As such, their value of 24% represented the best conservative estimate of occupancy controls energy savings achievable in the field today.

### SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = kWh * CF$$

Where:

kWh CF = As calculated above

= Summer peak coincidence demand (kW) to annual energy (kWh) factor.

= 0.0001899635 for indoor lighting

= 0.0001379439 for Miscellaneous

= 0.0000056160 for exterior lighting

Natural Gas Energy Savings

If gas heated building (or unknown):

#### $\Delta Therms = kW_{Controlled} * Hours * ESF * - IFTherms$

Where:

IFTherms = Lighting-HVAC Integration Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting and is provided in the Lighting Reference Table in Section 2.6 by building type.

# 2.6.11 Street Lighting

# **DESCRIPTION**

This measure characterizes the savings associated with LED street lighting conversions where a LED fixture replaces a high-intensity discharge (HID) outdoor lighting system, including metal halide, high pressure sodium, and mercury vapor. LED street lights provide considerable benefits compared to HID lights, including:

- Improved nighttime visibility and safety through better color rendering, more uniform light distribution and elimination of dark areas between poles.
- Reduced direct and reflected uplight which are the primary causes of urban sky glow.
- 40-80% energy savings (dependent on incumbent lighting source). •
- 50-75% street lighting maintenance savings.<sup>260</sup> •

This measure includes LED fixture housings including cobrahead and post-top and is applicable only where utility tariffs support LED street lighting conversions.

This measure was developed to be applicable for a one-to-one RF opportunity only.<sup>261</sup>

# **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment must be an LED fixture that meets the United Illuminating Rate Schedule, alongside all other luminary performance requirements, based on site characteristics<sup>262</sup> and all local, state and federal codes.

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is the existing lighting system -a metal halide, high pressure sodium, or mercury vapor outdoor lamp, ballast, and fixture.

# **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The measure life is assumed to be 12.5 years.<sup>263</sup>

#### **DEEMED MEASURE COST**

Actual measure installation cost should be used, including material and labor.<sup>264</sup> If the actual cost of the

http://www1.eere.energy.gov/buildings/ssl/consortium.html

<sup>&</sup>lt;sup>260</sup> See NEEP "LED Street Lighting Assessment and Strategies for the Northeast and Mid-Atlantic," January 2015, and the Municipal Solid State Street Lighting Consortium for more information

<sup>&</sup>lt;sup>261</sup> Many light fixtures were placed in service 20-50 years ago and may no longer service their intended purpose. It is important to conduct a comprehensive assessment of lighting needs with a lighting professional when considering a LED street lighting project. LED street lighting can result in removal of lighting altogether as LED lights provide better CRI and lighting levels than existing HID lighting types. While this measure only characterizes a one-to-one replacement value, it is recommended that this measure be updated following a Missouri assessment to see where LED street lighting has resulted in the removal of street lighting to ensure additional savings calculations are captured. Recommend using Street and Parking Facility Lighting Retrofit Financial Analysis Tool developed by DOE Municipal Solid-State Street Lighting Consortium and the Federal Energy Management Program. <sup>262</sup> See DOE Municipal Solid-State Street Lighting Consortium "Model Specifications for LED Roadway Luminaires v.2.0," July 2014.

<sup>&</sup>lt;sup>263</sup> The measure lifetime is calculated using 4,000 annual hours of use from Ameren Missouri "Light Emitting Diode (LED) Street and Area Lighting Report," July 2013 and a typical LED streetlight lifetime of 50,000 hours from Massachusetts Department of Energy Resources "LED Streetlights: What is Your Plan? (webinar)," September 11, 2013.

<sup>&</sup>lt;sup>264</sup> Labor should include the removal of the old fixture and installation of the new fixture. Assume the typical prevailing wage as per the Annual Wage Order No. 23 published by the Missouri Department of Labor.

LED unit is unknown, use the default values for typical LED streetlight retrofits provided below.<sup>265</sup>

Light output						
	Low (<50W) Med (50W-100W) High (>100W)			(>100W)		
Fixture Type	min	max	min	max	min	max
Decorative/Post Top	\$350.00	\$615.00	\$550.00	\$950.00	\$750.00	\$1,450.00

# 2.7.2 Computer Power Management Software

### DESCRIPTION

Computer power management software is installed on a network of computers. This is software which monitors and records computer and monitor usage, as well as allows centralized control of computer power management settings.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is defined by the requirements listed below:

- Allow centralized control and override of computer power management settings of workstations which include both a computer monitor and CPU (i.e. a desktop or laptop computer on a distributed network).
- Be able to control on/off/sleep states on both the CPU and monitor according to the network administrator-defined schedules and apply power management policies to network groups.
- Have capability to allow networked workstations to be remotely wakened from power-saving mode (e.g. for system maintenance or power/setting adjustments).
- Have capability to detect and monitor power management performance and generate energy savings reports.
- Have capability to produce system reports to confirm the inventory and performance of equipment on which the software is installed.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF BASELINE EQUIPMENT**

Baseline is defined as a computer network without software enforcing the power management capabilities in existing computers and monitors.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is 4 years.<sup>276</sup>

#### DEEMED MEASURE COST

The deemed measure cost is \$29 per networked computer, including labor.<sup>277</sup>

# 2.7.4 Computer Server

# DESCRIPTION

This measure estimates savings for a computer server with that has been certified by ENERGY STAR<sup>®</sup> (ES) Version 2.0.

This measure was developed to be applicable to the following program type: TOS. If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient product is computer server meeting the requirements set forth by ENERGY STAR<sup>®</sup> Version 2.0.

# **DEFINITION OF BASELINE EQUIPMENT**

Non ENERGY STAR<sup>®</sup> qualified computer server.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The life of this measure is 4 years.<sup>285</sup>

# **DEEMED MEASURE COST**<sup>286</sup>

The incremental cost is \$9.80.

#### LOADSHAPE

Miscellaneous BUS

#### Algorithm

#### CALCULATION OF ENERGY SAVINGS

#### ELECTRIC ENERGY SAVINGS<sup>287</sup>

Annual energy savings are based on the rated output of the server's power supply, according to the following table:

Power Supply Rated Output (W)	Baseline Annual Energy Consumption (kWh)	Efficient Annual Energy Consumption (kWh)	Annual Energy Savings (kWh)
Up to 500	1,221	742	479
501-1000	3,024	1,837	1,187
1001-1500	5,883	3,575	2,308
1501-2000	9,152	5,561	3,591

<sup>&</sup>lt;sup>285</sup> Consistent with Energy Star<sup>®</sup> computing equipment. It is important to note that lifetime doesn't necessarily reflect the expected functional lifetime of mechanical components, but rather the lifetime of operating system technology, which is generally assumed to become obsolete after a period of four years.

<sup>&</sup>lt;sup>286</sup> Computer CASE Report, CA IOUs. <u>http://www.energy.ca.gov/appliances/2013rulemaking/documents/proposals/12-AAER-2A Consumer Electronics/California IOUs Standards Proposal Computers UPDATED 2013-08-06 TN-71813</u>. The small

incremental cost is in alignment with Energy Star® reporting, which lists an incremental cost of \$0 for all office equipment. <sup>287</sup> Based on current Energy Star® qualified product performance and assumptions drawn from the Energy Savings From Energy Star®- Qualified Servers report and Energy Star® Computer Specifications version 4.0. See "Computer Server Savings.xlsx" for additional details and methodology.

Power Supply Rated Output (W)	Baseline Annual Energy Consumption (kWh)	Efficient Annual Energy Consumption (kWh)	Annual Energy Savings (kWh)

# 2.8 Motors

# **2.8.1 Motors**

# DESCRIPTION

This measure applies to the one-for-one replacement of an old, working or failed/near failure 1-350 horsepower, constant speed, uniformly loaded HVAC fan or pumping motor with a new motor of the same rated horsepower that meets or exceeds National Electrical Manufacturers Association (NEMA) Premium efficiency levels.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

# **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new motor that meets or exceeds NEMA Premium efficiency levels.

# **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment efficiency is the efficiency of the existing motor, or if unknown, the federal minimum required efficiency is assumed.

# DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>288</sup>

# DEEMED MEASURE COST

Actual incremental costs should be used if available. If actual costs are unknown, use default installed cost from table below.<sup>289</sup>

N/A

<sup>&</sup>lt;sup>293</sup> Since savings will be constant and without fluctuation over the period of operation, demand savings are simply the energy savings divided by the hours of operation. Demand savings are expected to coincide with peak demand period definitions, consistent with assumptions in VFD measures on HVAC pumps and fans.

# 2.8.2 Pool Pump

### DESCRIPTION

This measure applies to the installation of a variable frequency drive (VFD) on an existing single-speed pool pump at a commercial location. VFDs save energy by reducing the speed of the pool pump motor to match the pool's required flow rate. Additionally, VFD's soft-starting extends motor life by reducing wear.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new VFD meeting program requirements.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is an existing, single-speed pool pump without a VFD or other motor control device.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>294</sup>

#### DEEMED MEASURE COST

Actual costs (equipment and labor) should be used if available. If actual costs are unknown, assume equipment costs of \$200/motor horsepower and labor cost of \$46.<sup>295</sup>

# 2.8.3 Pool Pump Timer

### DESCRIPTION

This measure applies to the installation of a pump timer on an existing single-speed pool pump at a commercial location. Many times, it is not necessary to run a pool's circulation pump 24 hours a day. This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new pump timer meeting program requirements.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is an existing, single-speed pool pump without a VFD or other motor control device.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.

#### **DEEMED MEASURE COST**

Actual costs (equipment and labor) should be used if available. If actual costs are unknown, assume equipment costs of \$100.297

#### LOADSHAPE

# 2.8.4 Pump Optimization

#### DESCRIPTION

Pump improvements can be done to optimize the design and control of centrifugal water pumping systems, including water solutions with freeze protection up to 15% concentration by volume. Other fluid and gas pumps cannot use this measure calculation. The measurement of energy and demand savings for commercial and industrial applications will vary with the type of pumping technology, operating hours, efficiency, and existing and proposed controls. Depending on the specific application slowing the pump, trimming or replacing the impeller may be suitable options for improving pumping efficiency. Pumps up to 40 HP are allowed to use this energy savings calculation. Larger motors should use a custom calculation (which may result in larger savings than this measure would claim).

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is proven to be an optimized centrifugal pumping system meeting the applicable program efficiency requirements:

- Pump balancing valves no more than 15% throttled; and
- Balancing valves on at least one load 100% open.

### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline equipment is assumed to be the existing pumping system including existing controls and sequence of operations.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.<sup>298</sup>

### DEEMED MEASURE COST

The incremental capital cost for this measure can vary considerably depending upon the strategy employed to achieve the required efficiency levels and should be determined on a site-specific basis.

### 2.8.5 Variable Frequency Drives for Pumps and Fans on Hydronic HVAC Systems

#### DESCRIPTION

This measure applies to VFDs installed on HVAC chilled water distribution pumps, hot water distribution pumps, condenser water pumps and cooling tower fans. Back-up pumps/fans do not qualify for this measure. There is a separate measure for HVAC supply and return fans. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure was developed to be applicable to the following program types: TOS and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The VFD is applied to a pump or fan motor that does not have a VFD. The hydronic system that the VFD is applied to must have a variable or reduced load. Installation is to include the necessary control points and parameters (example: differential pressure, differential temperature, return water temperature) as determined by a qualified engineer.

#### **DEFINITION OF BASELINE EQUIPMENT**

The time of sale baseline is a new motor installed without a VFD or other methods of control. Retrofit baseline is an existing motor operating as is.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.<sup>302</sup>

#### **DEEMED MEASURE COST**

Customer-provided costs will be used when available. Default measure costs are listed below for 1 to 75 HP motors.<sup>303</sup> The average of the values below is \$179/HP.

HP	Cost
1-9 HP	\$1,874
10-19 HP	\$2,967
20-29 HP	\$4,060
30-39 HP	\$5,154
40-49 HP	\$6,247
50-59 HP	\$7,340
60-69 HP	\$8,433
70-75 HP	\$9,526
>75 HP	\$179/HP

<sup>&</sup>lt;sup>302</sup> Consistent with Ameren Missouri program assumptions.

<sup>&</sup>lt;sup>303</sup> Average costs observed by other Midwestern states energy efficiency programs – specific data reflects results from Iowa program costs.

# **2.8.6 Variable Frequency Drives for HVAC Supply and Return Fans**

#### DESCRIPTION

This measure applies to VFDs installed on HVAC supply fans and return fan. Back-up fans do not qualify for this measure. There is a separate measure for HVAC Pumps. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure is applicable to the following program types: TOS and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The VFD is applied to an HVAC fan motor that does not have a VFD. The air distribution system must have a variable or reduced load, and installation is to include the necessary control point as determined by a qualified engineer (example: differential pressure, temperature, or volume). Savings are based on the application of VFDs to a range of baseline system conditions, including no control, inlet guide vanes, outlet guide vanes, relief dampers, and throttling valves.

#### **DEFINITION OF BASELINE EQUIPMENT**

The TOS baseline is a new motor installed without a VFD or other methods of control. The RF baseline is an existing motor operating as is. RF baselines may or may not include guide vanes, throttling valves, or other methods of control.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.<sup>308</sup>

#### **DEEMED MEASURE COST**

Customer provided costs will be used when available. Default measure costs are listed below for up to 100 hp motors.<sup>309</sup> The average of the values below is \$168/HP.

HP	Cost
1-9 HP	\$1,874
10-19 HP	\$2,967
20-29 HP	\$4,060
30-39 HP	\$5,154
40-49 HP	\$6,247
50-59 HP	\$7,340
60-69 HP	\$8,433
70-79 HP	\$9,526
80-89 HP	\$10,620
90-100 HP	\$11,713
>100 HP	\$168/HP

<sup>&</sup>lt;sup>308</sup> Consistent with Ameren Missouri program assumptions.

<sup>&</sup>lt;sup>309</sup> Average costs observed by energy efficiency programs in Iowa.

# 2.9 Refrigeration

# 2.9.1 Commercial Solid and Glass Door Refrigerators & Freezers

### DESCRIPTION

This measure applies to ENERGY STAR<sup>®</sup> vertical closed and horizontal closed refrigerators or freezers installed in a commercial kitchen. ENERGY STAR<sup>®</sup> commercial refrigerators and freezers are more energy efficient because they are designed with components such as ECM evaporator and condenser fan motors, hot gas anti-sweat heaters, or high-efficiency compressors, which will significantly reduce energy consumption.

This measure was developed to be applicable to the following program type: TOS.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new ENERGY STAR<sup>®</sup> certified vertical closed or horizontal closed, solid or glass door refrigerator or freezer meeting energy consumptions requirements as determined by door type (solid or glass) and refrigerated volume (V).

Volume (ft <sup>3</sup> )	Maximum Daily Energy Consumption (kWh/day)		
	Refrigerator	Freezer	
Vertical Closed			
Solid Door			
0 < V < 15	$\leq 0.02V + 1.60$	$\leq$ 0.25V + 1.55	
$15 \le V < 30$	$\leq 0.09\mathrm{V} + 0.55$	$\leq$ 0.20V + 2.30	
$30 \le V \le 50$	$\leq 0.01 \mathrm{V} + 2.95$	$\leq$ 0.25V + 0.80	
$V \ge 50$	$\leq 0.06V + 0.45$	$\leq 0.14V + 6.30$	
Glass Door			
0 < V < 15	$\leq 0.10\mathrm{V} + 1.07$	$\leq 0.56V + 1.61$	
$15 \le V < 30$	$\leq 0.15V + 0.32$	$\leq$ 0.30V + 5.50	
$30 \le V \le 50$	$\leq 0.06V + 3.02$	$\leq 0.55 V - 2.00$	
$V \ge 50$	$\leq 0.08V + 2.02$	$\leq$ 0.32V + 9.49	
Horizontal Closed		-	
Solid or Glass Doors			
All Volumes	$\leq 0.06V + 0.60$	$\leq 0.10V + 0.20$	

#### ENERGY STAR<sup>®</sup> Requirements (Version 3.0, Effective October 1, 2014)

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new vertical closed or horizontal closed, solid or glass door refrigerator or freezer that is not ENERGY STAR<sup>®</sup> certified.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>316</sup>

<sup>&</sup>lt;sup>316</sup> Measure life from ENERGY STAR<sup>®</sup> Commercial Kitchen Equipment Savings Calculator which cites reference as "FSTC research on available models, 2009."

### **DEEMED MEASURE COST**

The incremental capital cost for this measure varies by size as shown in the table below:

Measure	Incremental Cost
Commercial Glass Door Freezers less than 15 ft <sup>3</sup>	\$220
Commercial Glass Door Freezers 15 to 30 ft <sup>3</sup>	\$950
Commercial Glass Door Freezers 30 to 50 ft <sup>3</sup>	\$1,307
Commercial Glass Door Freezers more than 50 ft <sup>3</sup>	\$2,300
Commercial Glass Door Refrigerators less than 15 ft <sup>3</sup>	\$250
Commercial Glass Door Refrigerators 15 to 30 ft <sup>3</sup>	\$500
Commercial Glass Door Refrigerators 30 to 50 ft <sup>3</sup>	\$1,307
Commercial Glass Door Refrigerators more than 50 ft <sup>3</sup>	\$2,300
Commercial Solid Door Freezers/Refrigerators less than 15 ft <sup>3</sup>	\$150
Commercial Solid Door Freezers/Refrigerators 15 to 30 ft <sup>3</sup>	\$400
Commercial Solid Door Freezers/Refrigerators 30 to 50 ft <sup>3</sup>	\$550
Commercial Solid Door Freezers/Refrigerators more than 50 ft <sup>3</sup>	\$700
Horizontal Closed - Solid or Glass Door Refrigerator (all	\$525
volumes)	
Horizontal Closed - Solid or Glass Door Freezer (all volumes	\$595

# 2.9.2 Refrigerated Beverage Vending Machine

#### DESCRIPTION

This measure applies to new ENERGY STAR<sup>®</sup>, Class A or Class B refrigerated vending machines. ENERGY STAR<sup>®</sup> vending machines incorporate more efficient compressors, fan motors, and lighting systems as well as a low power mode option that allows the machine to be placed in low-energy lighting and/or low-energy refrigeration states during times of inactivity.

This measure was developed to be applicable to the following program type: TOS.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a new or rebuilt ENERGY STAR<sup>®</sup>, Class A or Class B<sup>320</sup> refrigerated vending machine meeting energy consumptions requirements as determined by equipment type (Class A or Class B).

<b>ENERGY STAR Requirements (Version</b>	n 3.1, Effective March 1, 2013)
--	---------------------------------

Equipment Type	Maximum Daily Energy Consumption (kWh/day)
Class A	$\leq$ 0.0523V + 2.432
Class B	$\leq 0.0657V + 2.844$

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a new or rebuilt, Class A or Class B refrigerated vending machine that is not ENERGY STAR<sup>®</sup> certified.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>321</sup>

### **DEEMED MEASURE COST**

The incremental cost of this measure is \$140.322

### LOADSHAPE

Refrigeration BUS

Algorithm

CALCULATION OF SAVINGS

<sup>&</sup>lt;sup>320</sup> Class A means a refrigerated bottled or canned beverage vending machine that is fully cooled, and is not a combination vending machine. Class B means any refrigerated bottled or canned beverage vending machine not considered to be Class A, and is not a combination vending machine. See 10 CFR §431.292 "Definitions concerning refrigerated bottled or canned beverage vending machines."

<sup>&</sup>lt;sup>321</sup> Average of measure lives recognized by Ameren Missouri (10 years) and KCPL (14 years). Also consistent with Energy Star<sup>®</sup> commercial refrigerator lifetime.

<sup>&</sup>lt;sup>322</sup> Consistent with Ameren Missouri MEEIA 2016-18 and KCPL TRM assumptions.

#### **ELECTRIC ENERGY SAVINGS**

Custom calculation below.

$$\Delta kWh = (kWh_{Base} - kWh_{ESTAR}) * Days$$

Where:

kWh<sub>Base</sub> = Maximum daily energy consumption (kWh/day) of baseline vending machine

= Calculated as shown in the table below using the actual refrigerated volume (V)

Equipment Type	kWh <sub>Base</sub> <sup>323</sup>
Class A	0.055V + 2.56
Class B	0.073V + 3.16

kWh<sub>ESTAR</sub> = Maximum daily energy consumption (kWh/day) of ENERGY STAR<sup>®</sup> vending machine

= Custom or if unknown, calculated as shown in the table below using the actual refrigerated volume (V)

Equipment Type	kWhEE <sup>324</sup>
Class A	$\leq$ 0.0523V + 2.432
Class B	$\leq 0.0657V + 2.844$

V = Refrigerated volume <sup>32</sup>	$^{25}$ (ft <sup>3</sup> )
---------------------------------------	----------------------------

= Actual installed
--------------------

Days = Days of vending machine operation per year

= 365.25 days per year

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

Where:

ΔkWh	= Electric energy savings, calculated above
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor = $0.0001357383^{326}$

<sup>&</sup>lt;sup>323</sup> 33010 CFR §431.296 - Energy Conservation Standards for Refrigerated Bottled or Canned Beverage Vending Machines

<sup>&</sup>lt;sup>324</sup> ENERGY STAR® Version 3.1 requirements for maximum daily energy consumption.

<sup>&</sup>lt;sup>325</sup> V is measured by the American National Standards Institute (ANSI)/Association of Home Appliance Manufacturers (AHAM) HRF–1–2004, "Energy, Performance and Capacity of Household Refrigerators, Refrigerator-Freezers and Freezers." Measurement of refrigerated volume must be in accordance with the methodology specified in Section 5.2, Total Refrigerated Volume (excluding subsections 5.2.2.2 through 5.2.2.4), of ANSI/AHAM HRF–1–2004.

<sup>&</sup>lt;sup>326</sup> 2016 Ameren Missouri Coincident Peak Demand Factor for Commercial Refrigeration. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

# 2.9.3 Door Heater Controls for Cooler or Freezer

### DESCRIPTION

This measure applies to door heater controls installed on commercial coolers or freezers. There are two main categories of commercially available control strategies that achieve "on-off" control of door heaters based on either (1) the relative humidity of the air in the store or (2) the "conductivity" of the door (which drops when condensation appears). In the first strategy, the system activates door heaters when the relative humidity falls below that set point. In the second strategy, the sensor activates the door heaters when the door conductivity falls below a certain set point and turns them off when the conductivity rises above that set point. Savings result from a reduction in electric energy use due to heaters not running continuously and from reduced cooling loads when heaters are off. The assumptions included within this measure assume that door heater controls which are properly designed and commissioned will achieve approximately equivalent savings, regardless of control strategy.

This measure applies to the following program type: RF.

### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be a door heater control installed on a commercial glass door cooler or freezer.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is a door heater without controls, installed on a commercial glass door cooler or freezer.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT The expected measure life is assumed to be 12 years.<sup>327</sup>

### DEEMED MEASURE COST

Actual incremental costs should be used if available. The incremental capital cost \$151 per door.<sup>328</sup>

### LOADSHAPE

### 2.9.4 Electronically Commutated Motors (ECM) for Walk-in and Reach-in Coolers/Freezers

#### DESCRIPTION

This measure consists of replacement of an existing, uncontrolled, and continuously operating standard efficiency shaded-pole evaporator fan motor in refrigerated display cases or fan coil in walk-ins.

This measure achieves savings by installing a more efficient motor, thereby moving the same amount of air with less energy requirements. Additionally, less waste heat is produced, resulting in a decreased refrigeration load.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

This measure applies to the replacement of an existing standard-efficiency shaded-pole evaporator fan motor in refrigerated display cases or fan coil in walk-ins. The replacement unit must be an electronically commutated motor (ECM). Savings assume that efficient motors operate continuously.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline is the existing shaded-pole motor(s) with no fan control operating 8760 hours continuously in a refrigerated display case or fan coil unit of a walk-in cooling unit.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>334</sup>

#### **DEEMED MEASURE COST**

The measure cost is assumed to be \$177 per motor for a walk in cooler and walk in freezer, including the cost of the motor plus installation.<sup>335</sup>

#### LOADSHAPE

Miscellaneous BUS

#### Algorithm

#### CALCULATION OF SAVINGS

Savings are based on a measure created by Energy & Resource Solutions for the California Municipal Utilities Association and supported by PGE workpaper PGE3PREF126. Note that climate differences across all California climate zones resulted in negligible savings differences, which indicates that the average savings for the California study should apply equally as well to Missouri. Savings found in the aforementioned source are presented in combination with savings from controllers, however for the purposes of this measure only those associated with the ECM upgrade are considered.

<sup>&</sup>lt;sup>334</sup> DEER database.

<sup>&</sup>lt;sup>335</sup> Difference in the fully installed cost (\$468) for ECM motor and controller, listed in Work Paper PGE3PREF126, "ECM for Walk-In Evaporator with Fan Controller," June 20, 2012, and the measure cost specified in the DEER database for controller (\$291).

# ELECTRIC ENERGY SAVINGS

 $\Delta kWh = Savings per motor * motors Where:$ 

Savings per motor<sup>336</sup> = based on the motor rating of the ECM motor:

Evaporator Fan Motor Rating (of ECM)	Annual kWh Savings/motor
16W	408
1/15 - 1/20HP	1,064
1/5HP	1,409
1/3HP	1,994
1/2HP	2,558
3/4HP	2,782

motors = number of fan motors replaced

### SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * CF$$

Where:

$\Delta kWh$	= Electric energy savings, as calculated above.
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001379439

### 2.9.5 Strip Curtain for Walk-in Coolers and Freezers

#### DESCRIPTION

This commercial measure pertains to the installation of infiltration barriers (strip curtains) on walk-in coolers or freezers. Strip curtains impede heat transfer from adjacent warm and humid spaces into walk-ins when the main door is opened, thereby reducing the cooling load. As a result, compressor run time and energy consumption are reduced. The engineering assumption is that the walk-in door is open for varying durations per day based on facility type, and the strip curtain covers the entire door frame. All assumptions are based on values that were determined by direct measurement and monitoring of over 100 walk-in units in the 2006-2008 evaluation for the CA Public Utility Commission.<sup>337</sup>

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is a strip curtain added to a walk-in cooler or freezer. The new strip curtain must cover the entire area of the doorway when the door is opened.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline assumption is a walk-in cooler or freezer that previously had either no strip curtain installed or an old, ineffective strip curtain installed.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 4 years.<sup>338</sup>

#### **DEEMED MEASURE COST**

The incremental capital cost for this measure is \$10.22/sq ft of door opening.<sup>339</sup>

## 2.10.1 Windows

### DESCRIPTION

Energy and demand saving are realized through the installation of windows that offer performance improvements over baseline windows. Savings may be realized from reducing air infiltration, improved insulating properties, and changes to solar heat gain through the glazed surfaces of the building.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of the IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing window assemblies.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC 2012. An efficient window would have specifications not exceeding these values.

	Climate Zones 4 & 5
<b>U-Factor</b>	
Fixed Windows	0.38 Btu/ft <sup>2</sup> .°F.h
<b>Operable</b> Windows	0.45 Btu/ft <sup>2</sup> .°F.h
SHGC	0.40

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.<sup>343</sup>

## **DEEMED MEASURE COST**

For retrofit projects, full installation costs should be used, including both material and labor costs to install the windows.

In all other scenarios, the incremental cost for this measure is assumed to be \$1.50 per square foot of window area.<sup>344</sup>

### LOADSHAPE

Cooling BUS

Algorithm

<sup>&</sup>lt;sup>343</sup> Consistent with window measure lives specified by Ameren Missouri and KCP&L.

<sup>&</sup>lt;sup>344</sup> Alliance to Save Energy Efficiency Windows Collaborative Report, December 2007. Consistent with other market reports.

### CALCULATION OF ENERGY SAVINGS

### ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building.

 $\Delta kWh = \Delta kWh cooling + \Delta kWh heating$ 

Heating and cooling savings are composed of three components: infiltration, conduction and solar gains. In instances where infiltration savings do not apply or are not eligible, it may be disregarded. If central cooling, the electric energy saved in annual cooling due to the added insulation is:

$\Delta kWh$ cooling	$= Infltration_{cooling} + Conduction_{cooling} + Solar_{cooling}$			
<i>Infiltration</i> <sub>cooling</sub>	(CFMPre_CFMPost)	* 60 *EFLHcooli	ng $*\Delta T$ AVG,ling	* 0.018 * <i>LM</i>

### 2.10.2 Ceiling and Wall Insulation

#### DESCRIPTION

Energy and demand saving are realized through reductions in the building cooling and heating loads.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

#### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing insulation. It should be based on the entire wall assembly.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC 2012:

	ASHRAE/IECC Climate Zone 5 (A, B, C) Nonresidential		
	Assembly Maximum	Insulation Min. R-Value	
Mass	U-0.078	R-11.4 ci	
Metal Building	U-0.052	R-13 + R-13 ci	
Metal Framed	U-0.064	R-13 + R-7.5 ci	
Wood Framed and Other	U-0.064	R-13 + R-3.8 ci or R-20	

	ASHRAE/IECC Climate Zone 6 (A, B, C) Nonresidential	
	Assembly Maximum	Insulation Min. R-Value
Mass	U-0.078	R-13.1 ci
Metal Building	U-0.052	R-13 + R-13 ci
Metal Framed	U-0.064	R-13 + R-7.5 ci
Wood Framed and Other	U-0.051	R-13 + R-7.5 ci or R-20 + R-3.8 ci

*Note: ci* = *continuous insulation* 

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure expected useful life (EUL) is assumed to be 20 years per DEER 2008. This is consistent with SDG&E's 9th Year Measure Retrofit Study (1996 & 1997 Residential Weatherization Programs), CPUC's Energy Efficiency Policy Manual v.2, and GDS's Measure Life Report Residential and Commercial/Industrial Lighting and HVAC Measures (June 2007).

#### **DEEMED MEASURE COST**

For retrofit projects, full installation costs should be used.

For new construction projects, costs should be limited to incremental material and labor costs associated with the portion of insulation that exceeds code requirements.

#### LOADSHAPE

HVAC BUS

#### Algorithm

#### CALCULATION OF ENERGY SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building

$$\Delta kWh = \Delta kWh_{\text{cooling}} + \Delta kWh_{\text{heating}}$$

If central cooling, the electric energy saved in annual cooling due to the added insulation is

$$\Delta kWh_{cooling} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{cooling} * \Delta T_{AVG,cooling}}{(1,000 * \eta_{cooling})}$$

Where:

Rexisting	= Assembly heat loss coeffi	icient with existing	g insulation [(hr- <sup>0</sup>	F-ft <sup>2</sup> )/Btu]
Rnew	= Assembly heat loss coeffi	icient with new in	sulation [(hr- <sup>0</sup> F-ft	<sup>2</sup> )/Btu]
Area	= Area of the surface in square feet.			
CRF	= Correction Factor. Adjust overall assembly R-value, v			framing has on the
	= 100% if Spray Foam or E	xternal Rigid Foa	m	
	= 50% if studs and cavity in	nsulation <sup>349</sup>		
$EFLH_{cooling}$	= Equivalent Full Load Hou HVAC End Use	urs for Cooling [hi	r] are provided in	Section 2.7,
$\Delta T$ AVG,cooling	= Average temperature diff temperature and assumed 7.		, <b>U</b>	etween outdoor air
	Weather Basis (City	OAAVG,cooling	$\Delta { m TAVG},$ cooling	
	based upon)	[°F] <sup>350</sup>	[° <b>F</b> ]	
S	t Louis, MO	80.8	5.8	

<sup>&</sup>lt;sup>349</sup> Consistent with the information listed in ASHRAE, 2001, Table 5-1 Wall Sections with Steel Studs Parallel Path Correction Factors and experimental findings by the Oak Ridge National Laboratory, "Couple Secrets about How Framing is Effecting the Thermal Performance of Wood and Steel-Framed Walls."

<sup>&</sup>lt;sup>350</sup> National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old\_data/nsrdb/1991-2005/tmy3/by\_state\_and\_city.html. Heating Season defined as September 17th through April 13th, cooling season defined as May 20 through August 15th. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

1,000= Conversion from Btu to kBtu
$$\eta_{cooling}$$
= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)= Actual

If the building is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

$$\Delta kWh_{heating} = \left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{heating} * \Delta T_{AVG,heating}$$

$$(3,412 * \eta_{heating})$$

Where:

<b>EFLH</b> <sub>heating</sub>	= Equivalent Full Load Hours for Heating [hr] are provided in Section 2.7,
	HVAC end use

 $\Delta T_{AVG,heating}$  = Average temperature difference [<sup>0</sup>F] during heating season between outdoor air temperature and assumed 55<sup>0</sup>F heating base temperature

	Weather Basis (City based upon)	$OA_{AVG,heating}$ $[^{\circ}F]^{351}$	$\Delta { m TAVG},$ heating [° ${ m F}$ ]
	St Louis, MO	43.2	11.8
3,412	= Conversion from Btu to	kWh.	
ηheating	= Efficiency of heating sys	stem	
•	= Actual. <i>Note: electric re</i>	sistance heating	and heat pumps
	efficiency greater than or a	equal to 100%	

If the building is heated with a gas furnace, there will be some electric savings in heating the building attributed to extra insulation since the furnace fans will run less.

 $\Delta kWh_{heating} = \Delta Therms * Fe * 29.3$  Where:

ΔTherms	= Gas savings calculated with equation below.
Fe	= Percentage of heating energy consumed by fans, assume $3.14\%^{352}$
29.3	= Conversion from therms to kWh

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWH_{cooling} * CF$$

Where:

 $\Delta kWH_{cooling}$ 

= Annual electricity savings for cooling, as calculated above

<sup>&</sup>lt;sup>351</sup> National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old\_data/nsrdb/1991-2005/tmy3/by\_state\_and\_city.html. Heating Season defined as September 17<sup>th</sup> through April 13<sup>th</sup>, cooling season defined as May 20 through August 15<sup>th</sup>. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

 $<sup>^{352}</sup>$  F<sub>e</sub> is not one of the AHRI certified ratings provided for furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14% for residential units. This is, appropriately, ~50% greater than the Energy Star<sup>®</sup> version 3 criteria for 2% F<sub>e</sub>. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference. Assumed to be consistent with C&I applications.

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor for Cooling = 0.0004439830

#### NATURAL GAS SAVINGS

If building uses a gas heating system, the savings resulting from the insulation is calculated with the following formula.

$$\Delta \text{Therms} \qquad \frac{=\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{heating} * \Delta T_{AVG,heating}}{(100,000 * \eta_{heat})}$$

Where:

= Assembly heat loss coefficient with existing insulation [(hr- <sup>0</sup> F-ft <sup>2</sup> )/Btu]
= Assembly heat loss coefficient with new insulation [(hr- <sup>0</sup> F-ft <sup>2</sup> )/Btu]
= Area of the surface in square feet. Assume 1000 sq ft for planning.
= Equivalent Full Load Hours for Heating are provided in Section 2.7, HVAC end use
= Average difference $[{}^{0}F]$ during heating season (see above)
= Conversion from BTUs to Therms
= Efficiency of heating system
= Actual
