DIRECT TESTIMONY

OF

JOLIE L. MATHIS

UNION ELECTRIC COMPANY,

d/b/a AMERENUE

CASE NO. EC-2002-1

Q. Please state your name and business address.

A. Jolie L. Mathis, P.O. Box 360, Jefferson City, MO 65102.

Q. By whom are you employed and in what capacity?

A. I am employed by the Missouri Public Service Commission (Commission) as an Engineer in the Engineering and Management Services Department.

Q. What are your duties as an Engineer in the Engineering and Management Services Department?

A. I am responsible for depreciation calculations and studies of companies regulated by the Commission.

Q. Would you please state briefly your qualifications, educational background and experience?

A. I graduated from Prairie View A&M University of Texas in August of 1993, with a Bachelor of Science degree in Electrical Engineering. During my college years I had internships with Allied Signal Aerospace Company, Missouri Public Service Company and Sprint United Telephone Co. – Midwest Division. In 1994 I accepted my current position. I have received four weeks of formal training from Depreciation

Direct Testimony of
Jolie Mathis

1 Programs, Inc., Kalamazoo, Michigan. Topics included actuarial and simulated service
2 life analysis and techniques, forecasting life, forecasting salvage and cost of removal, and
3 models for analyzing both aged and unaged data.

4 Q. Have you previously filed testimony with the Commission?

5 A. Yes, I have. Attached as Schedule 1 to my direct testimony is a list of
6 cases in which I have previously filed testimony.

7 Q. What is the purpose of your testimony in this docket?

8 A. The purpose of my testimony is to present the Commission Staff's
9 (Staff's) position and methods on: 1) supporting the depreciation rate schedule for
10 AmerenUE (Company), attached as Schedule 2 to this testimony, which the Staff has
11 developed for purposes of its earnings audit of AmerenUE; 2) to discuss the elimination
12 of net salvage from depreciation calculations, which the Staff believes is appropriate for
13 the determination of depreciation expense; and 3) to discuss the treatment of the
14 theoretical reserve imbalance.

15 Q. When were depreciation rates for AmerenUE last ordered by the
16 Commission?

17 A. Depreciation rates were last ordered in Case No. ER-83-163 on July 6,
18 1983, excluding Callaway Nuclear Power Plant and the coal cars account. On that date
19 the Commission issued a Report And Order that, among other things, directed that
20 "Union Electric shall implement and book new depreciation rates as of August 1, 1983 as
21 specified in paragraph 4 of the stipulation and agreement."

22 Q. Has the Staff conducted a depreciation study of the electric utility property
23 of AmerenUE?

Direct Testimony of
Jolie Mathis

1 A. Yes. I performed a depreciation study based on the Company's records
2 reflecting data up to year-end 1995.

3 Q. Why didn't the Staff use more current data?

4 A. According to Commission Rule 4 CSR 240-20.030, the Company
5 previously was due to submit its most current depreciation study, data base and property
6 unit catalog by July 1, 1996, to include year-end 1995 data. The Company submitted
7 such items to the Manager of the Energy Department on January 29, 1997. In Data
8 Request No. 4702 in this case, the Staff requested more recent data through year-end
9 1998 and beyond. However, the Company declined to provide such data, citing
10 Commission Rule 4 CSR 240-20.030. The Company would not provide data outside of a
11 general rate case or before the due date of its next study, which would be July 1, 2001. A
12 copy of the Company's response to the Staff's data request is attached as Schedule 4 to
13 this testimony. On June 22, 2001, the Company filed a Notice of Intent to File
14 Depreciation Study and Data Base and Property Study Unit Catalog prior to January 29,
15 2002.

16 Q. Did you tour the electric facilities of AmerenUE?

17 A. Yes. The Staff conducted a field inspection and discussed plant operations
18 and plans for property retirement with local AmerenUE operators at several locations.
19 Those locations included:

20	<u>Coal Fired Plant</u>	<u>Hydroelectric Plant</u>
21	Labadie (2,300 MW)	Osage (212 MW)
22	Rush Island (1,156 MW)	Taum Sauk (440 MW)
23	Meramec (876 MW)	

Direct Testimony of
Jolie Mathis

1 Sioux (950 MW)

2 The Sioux Plant was toured in November 2000; the remaining plants were toured
3 in the Spring of 2001. The Callaway Plant was not toured and was not an issue in the
4 Staff's audit.

5 Q. Why isn't the Callaway Plant an issue?

6 A. The Callaway Plant, which is a nuclear unit, is addressed under a different
7 statute and Commission rule than other AmerenUE generating facilities. The Callaway
8 Plant is covered by Section 393.292 RSMo (2000) and 4 CSR 240-20.070. The most
9 recent case involving decommissioning of the Callaway Plant was Case No.
10 EO-2000-205. The last decommissioning cost study that was submitted for the Callaway
11 Plant was filed on September 1, 1999 and an Order Approving Stipulation And
12 Agreement was issued by the Commission on January 4, 2000. Pursuant to 4 CSR
13 240.070(9), the next Callaway decommissioning cost study will be filed with the
14 Commission on September 1, 2002.

15 Q. How much time did you spend analyzing AmerenUE's accounts for
16 depreciation?

17 A. I spent six months analyzing all 50 accounts. Two months were devoted
18 to the Production Accounts, another two months were spent on Transmission and
19 Distribution Plant Accounts, and a final two months focused on General Plant Accounts.
20 My analysis produced a survivor curve fit for 25 out of the 50 accounts, which
21 represented 54% of electric plant in service.

22 Q. Why was there no curve fit on the other 25 accounts?

1 A. The accounts had so few retirements that a resulting curve fit was non-
2 reliable.

3 Q. What is the balance of the accounts fitted to curves and the balance of the
4 accounts not fitted to curves?

5 A. Accounts fitted to curves amount to \$2,260,367,364, or 56% of electric
6 plant-in-service in 1995. The remaining \$3,010,678,513 of the accounts did not produce
7 reliable curve fits.

8 **DEPRECIATION CONCEPTS**

9 Q. Would you please define depreciation?

10 A. Yes. The National Association of Railroad and Utilities Commissioners in
11 1958 approved this definition:

12 "Depreciation," as applied to depreciable utility plant, means the
13 loss in service value not restored by current maintenance, incurred
14 in connection with the consumption or prospective retirement of
15 utility plant in the course of service from causes which are known
16 to be in current operation and against which the utility is not
17 protected by insurance. Among the cause to be given
18 consideration are wear and tear, decay, action of the elements,
19 inadequacy, obsolescence, changes in the art, changes in demand,
20 and requirements of public authorities.

21 [Source: Public Utility Depreciation Practices, August 1996,
22 Published by the National Association of Regulatory Utility
23 Commissioners]
24

25 Q. What does this definition mean to you?

26 A. This definition means that depreciation is a cost of providing service and
27 that a public utility should recover the capital invested in equipment needed to provide
28 the required service over the property's service life.

29 Q. How did you determine the annual accrual for the Company in this case?

30 A. I divided the original cost of property by its average service life (ASL).

Direct Testimony of
Jolie Mathis

1 Q. What is the ASL?

2 A. The ASL, in years, is the average expected life of all units of a group of
3 property, regardless of the placement date. The ASL is determined by actuarial analysis
4 of records of annual additions, retirements by vintage and balances, as well as
5 information provided by engineering and operations personnel. Survivor curve estimates
6 from other electric companies are also considered.

7 Q. How did you determine the ASLs used in your depreciation rate
8 calculations?

9 A. I used the survivor curve method.

10 Q. Please discuss the application of the survivor curve method.

11 A. It is a statistical method in which the underlying assumption is that if
12 history does tend to repeat itself, the service life of the new unit of property will be
13 reflected in the history of the retired units of that property.

14 AmerenUE's historical mortality data for an account is plotted and the stub curve
15 (curve representing dollars surviving that does not reach 0%) is compared to the known
16 shape of a set of Iowa curves. Survivor curve models, such as the Iowa curves, are
17 widely used to simplify life analysis and forecasting. These curves were developed at the
18 Iowa State College's Iowa Engineering Experiment Station 65 years ago. Three of the
19 four families of curves include a base group of 176 industrial property mortality curves,
20 and 18 types, published in Bulletin 125 of Iowa State University's Engineering Research
21 Institute, entitled "Statistical Analysis of Industrial Property Retirements."

22 The classification of the survivor curves was made according to whether the mode
23 (highest point) of the frequency curves was to the left, to the right or comparable with

Direct Testimony of
Jolie Mathis

1 average service life. The result included six left modal (L0,L1,L2,L3,L4,L5); five right
2 modal (R1,R2,R3,R4,R5); and seven symmetrical curves (S0,S1,S2,S3,S4, S5,S6). In
3 1957, a fourth family was presented consisting of the four "O" type survivor curves
4 (O1,O2,O3,O4). Today, these survivor curve types are used extensively in public utility
5 depreciation studies.

6 Q. How do you determine the ASL from these curves?

7 A. The area under the chosen Iowa curve represents the ASL for that unit of
8 property. Please refer to Schedule 3, attached to this testimony, for examples.

9 Q. What is useful in evaluating which type curve, with its life parameter,
10 most nearly matches the stub survivor curve?

11 A. The criterion used in determining a good fit is the residual measure shown
12 on the printed curve fitting output. The residual measure is the square root of the average
13 difference, squared, between the percents surviving on the fitted smooth curve and the
14 stub curve. The lower the residual measure is, the better the degree of conformity. The
15 range of fit shown opposite the residual measure indicates the age range used in the curve
16 fitting process and computation of the residual measure. The survivor curve graph and
17 residual measure table for Accounts 365, 364 and 362 are attached to my testimony as
18 Schedule 3. These three accounts represent change in accrual dollars that total over
19 \$1 million each due to the extension of lives.

20 **ACCOUNT 365**

21 Q. Please describe what may be found in Account 365.

22 A. Account 365 contains capacitors, aerial cable, regulators, arresters and
23 transformers.

1 Q. Please explain your approach to the determination of the average service
2 life for Account 365.

3 A. The life ordered in 1983 was 36 years. I am recommending a longer life
4 of 51 years. The survivor curve method was used against two sets of data, an experience
5 band of 1908 to 1995, and a more recent experience band of 1956 to 1995. These bands
6 were chosen to compare an overall technology to a more recent technology, resulting in
7 two curves each with an ASL of 51 years, and an L0 Iowa curve shape.

8 **ACCOUNT 364**

9 Q. Please describe what may be found in Account 364.

10 A. Account 364 contains wooden and steel poles, and steel towers.

11 Q. Please explain your approach to the determination of the ASL for Account
12 364.

13 A. The life ordered in 1983 was 36 years. I am recommending a longer life
14 of 41.7 years. The survivor curve method was used against two sets of data: an
15 experience band of 1908 to 1995, and a more recent experience band of 1956 to 1995.
16 These bands were chosen to compare an overall technology to a more recent technology
17 resulting in two curves with an ASL of 41.7 years, and an R2 Iowa curve shape.

18 **ACCOUNT 362**

19 Q. Please describe what may be found in Account 362.

20 A. Account 362 consists of equipment at Missouri substations ranging in size
21 from small, pole-mounted substations to large bulk substations. This includes circuit
22 breakers, bank capacitors, transformers and switchgear.

Direct Testimony of
Jolie Mathis

1 Q. Please explain your approach to the determination of the average service
2 life for Account 362.

3 A. The life ordered in 1983 was 44 years. I am recommending a longer life
4 of 58 years. The survivor curve method was used against a placement and experience
5 band of 1903 to 1995, resulting in an R2.5 Iowa curve shape with an ASL of 58 years.

6 Q. What parameters did you use to calculate your recommended depreciation
7 rates?

8 A. Each life analysis is based on a method, procedure and technique.

9 Q. Please define those terms as they relate to depreciation.

10 A. The method is a pattern of depreciation in relation to an accounting period,
11 such as straight-line or sum-of the years' digits, which charges an amount to each
12 accounting period over the service life of a group of properties. The straight-line method
13 charges an equal amount to each accounting period. The procedure is the grouping of
14 assets, such as Broad Group, where all units of plant within a particular depreciation
15 category, usually a plant account or subaccount, are considered as a single group. The
16 technique refers to the portion of the average life used in the calculation of depreciation,
17 such as whole life, which bases the depreciation rate on the estimated ASL of the plant
18 category.

19 Q. What method, procedure and technique did you use in your depreciation
20 study?

21 A. I used the straight-line method, the broad group procedure, and the whole
22 life technique, excluding net salvage from the formula.

1 **NET SALVAGE**

2 Q. Would you please define net salvage?

3 A. Net salvage is the gross salvage for the property retired, less its cost of
4 removal. Gross salvage is the amount recorded for the property retired due to the sale,
5 reimbursement or reuse of the property. Cost of removal is the cost incurred in
6 connection with the retirement of depreciable plant from service.

7 Q. What is the whole life depreciation rate formula?

8 A. The formula is:

9
$$[\text{Depreciation Rate} = (100\% - \text{Net Salvage\%}) / \text{Average Service Life}]$$

10 Q. What are you recommending for treatment of net salvage in this case?

11 A. Future net salvage cost (the marketable value of retired plant minus the
12 plant's cost of removal), that will not occur in most cases for several decades, should not
13 be collected from customers in the amount estimated by the whole life depreciation rate
14 formula.

15 Q. What is your alternative to using the whole life formula to collect future
16 net salvage?

17 A. My solution is to remove the net salvage factor from the whole life
18 formula for depreciation rate determination. Rather, depreciation should be the
19 determination of average service life and a subsequent depreciation rate that recovers the
20 capital cost of the original investment. Net salvage cost will be based on a current
21 expense determination made by the Staff auditors. See the direct testimony of Staff
22 Accounting witness James D. Schwieterman. Future net salvage costs should not be
23 collected from customers until they occur.

1 **NET SALVAGE COST**

2 Q. What is net salvage cost?

3 A. Net salvage cost is the collection of any scrap or resale value of the retired
4 plant less the cost to remove plant at interim and/or final retirement dates. Currently, for
5 most companies, the cost to remove plant exceeds the scrap value of the same plant when
6 all accounts are combined; therefore, it is reasonable to consider net salvage a cost. It is
7 the Staff's proposal that net salvage cost be separated into two types as has been
8 historically recognized by the Commission.

9 Q. Can you explain the two types of net salvage cost recognized, in the past,
10 by the Commission?

11 A. The Commission has historically recognized both "final net salvage cost"
12 and "interim net salvage cost" of life span property. Examples of life span property
13 subject to "interim net salvage cost" and "final net salvage cost" would be plant, such as
14 buildings, gas holders and power plants. Interim retirements are the retirement of units of
15 plant during the life of a life span type property. These interim retirements cause an
16 "interim net salvage cost" as will be explained later. A final retirement occurs when all
17 units of a life span property in a specific account are retired together, regardless of age.
18 A final retirement causes a "final retirement cost."

19 There are final retirements of plant in mass property accounts, also (accounts with
20 many units of plant that are not part of a larger unit, i.e., mains, services, poles, etc.).
21 Mass property retirements are booked frequently and, usually, there are many units
22 retired each year. These mass property retirements also cause a "final net salvage cost."
23 Both the "interim retirement cost" of life span property accounts and the "final retirement

1 cost" of mass property accounts can be evaluated using the same methodology. The Staff
2 auditors can evaluate and determine an aggregate net salvage cost for all of these
3 retirements and include it as a recurring expense with other audit results. This will
4 provide benefits to the regulated utility companies and their customers.

5 Q. How would the Staff make this separation of net salvage cost into two
6 types?

7 A. The final retirement of a life span property frequently includes a major
8 demolition project and a rehabilitation of the site where the plant was located
9 (greenfielding). These projects do not occur frequently and are normally after a long "in
10 service" period. For example, the Laclede Gas Company's gas holders in St. Louis are in
11 the range of 100 years old and are still in use. Their removal will be the final retirement
12 of a life span property. The responsibility to determine this type of net salvage cost (life
13 span "final retirement cost") would remain with the depreciation engineers due to the
14 need to evaluate demolition and "greenfielding" projects. This is one of the two types of
15 net salvage cost. Ameren does not currently have a greenfielding project.

16 The other type of net salvage cost includes two separate values that will be
17 determined by the Staff auditors as an expense item. One value is the "interim net
18 salvage cost" of life span property and the other value is the "final net salvage cost" of
19 mass property. Life span property's units of plant may be retired and replaced several
20 times during the life of the life span property. For example, if the roof on a building is
21 considered a unit of plant, it may need to be retired and replaced every 20 years while the
22 building will remain in service for 100 years or more. Therefore, the roof may be
23 replaced four or five times during the life span of the building. These retirements are

1 interim retirements and occur repeatedly, and with a reasonable frequency. Also, the
2 final retirements of plant in the mass property accounts, like mains for gas and water or
3 poles for electric, occur with a reasonable frequency. Retirements from mass property
4 accounts such as mains, services and meters tend to be relatively constant from year to
5 year with some trends due to growth of the account or other events such as regulatory
6 requirements to replace old services. They are a type of net salvage cost that is best
7 determined as an expense by the Staff auditors.

8 The first type of net salvage cost discussed, "final net salvage cost" of life span
9 property, is different in frequency and requires technical evaluation of the demolition and
10 "greenfielding." This type of net salvage cost is best determined by depreciation
11 engineers and recovered as an amortization. The Accounting Staff and the Engineering
12 and Management Services will identify the two types of net salvage cost, and the
13 appropriate Staff members will address each type.

14 Q. Has the Commission ruled on the net salvage issue in any previous cases?

15 A. Yes. In Case No. GR-99-315, Laclede Gas Company, the Commission
16 ruled that current depreciation rates should reflect a net salvage component of the
17 depreciation rate that, when multiplied by the plant balance, gives an annual accrual
18 consistent with the current net salvage amount experienced by the Company.

19 **HANDLING OF NET SALVAGE COST BY OTHER STATES**

20 Q. Have other states separated the net salvage cost, that will be determined by
21 the auditors in the Staff's proposal, from the depreciation accrual calculation?

1 A. Yes. In 1962, the state of Pennsylvania removed the net salvage
2 component from depreciation rates (*See Penn Sheraton Hotel v. Pennsylvania Public*
3 *Utility Commission*, 198 P.Super. 618, 184 A.2d 324, 45 P.U.R.3d 353 (1962)).

4 Q. How will this treatment of net salvage cost benefit utility companies and
5 their customers?

6 A. The customers of each Commission regulated utility company will be
7 certain they are paying to the regulated utility company, funds that are currently needed
8 for a specific purpose. The regulated utility will be certain that they are collecting, in
9 customer rates, what the regulated utility company is currently spending for all net
10 salvage cost and has spent for capital investment.

11 **THEORETICAL RESERVE**

12 Q. Would you please define theoretical reserve?

13 A. Theoretical reserve is the calculated balance that would be in the
14 accumulated depreciation account if recommended depreciation parameters were used.

15 Q. Will you please discuss the theoretical reserve in this case?

16 A. Yes. The actual 1995 reserve is \$1,016,854,188, representing 45% of
17 actual plant-in-service in 1995. The Staff's theoretical reserve is \$547,649,934 or 25% of
18 actual plant-in-service in 1995. The Company is over-accrued by \$469,204,254. On
19 June 22, 2001, the Company filed a Notice of Intent to File Depreciation Study and
20 Database and Property Unit Catalog on or before January 31, 2002. The Staff will review
21 the theoretical reserve at that time.

22 Q. How do you recommend that this deficiency in theoretical reserve be
23 recovered?

1 A. Recognizing the Company's desire to avoid rate shock, the reserve over-
2 recovery should be reduced over a 20-year period, at \$23,460,213 per year.

3 **STAFF'S POSITION FOR THIS CASE**

4 Q. What is the annual accrual amount for the Company based on
5 December 31, 2000 plant balances in Schedule 2?

6 A. I have determined that the annual depreciation accrual based on
7 December 31, 2000 plant balances should be \$220,920,532.

8 Q. What is the combined total of net salvage cost and the annual depreciation
9 accrual?

10 A. The combined total of the annual expense for net salvage cost is
11 \$9,043,332, plus the annual accrual of \$220,920,532 equals \$229,963,864. The Staff
12 auditors determined the annual expense for net salvage cost.

13 Q. Is this amount greater, the same or less than the annual accrual using the
14 currently ordered rate?

15 A. It is less. Using the currently ordered rates, the annual accrual would be
16 \$258,710,355, which is \$28,746,491 more than the combined total.

17 Q. Why is the annual accrual using currently ordered rates higher than the
18 combined total?

19 A. As has been discussed throughout this testimony, the currently ordered
20 rates include a net salvage cost determination that estimates unknown future cost in the
21 current annual accrual.

22 Q. What actions do you propose for this case based on your information and
23 determinations?

Direct Testimony of
Jolie Mathis

1 A. It is my proposal that: 1) the depreciation rates given in Schedule 2 be
2 ordered; 2) the net salvage cost as explained in my testimony, be ordered as an expense,
3 in the amount presented by the Staff auditors; and 3) the Commission approves a 20 year
4 amortization of the \$469,204,254 over-recovery of the theoretical reserve from past
5 utility customers at \$23,460,213 per year.

6 Q. Does this conclude your direct testimony?

7 A. Yes, it does.

DATA INFORMATION REQUEST

Ameren UE

CASE NO. EM-96-149

Requested From: Ms. Eileen Bauman

Date Requested: 07/28/00

Information Requested:

Please provide the following data on the existing electric plant and facilities in Missouri:

- a) Aged retirement data files in attached Gannett Fleming format, which document original cost of company plant facilities by vintage by plant account.
- b) Depreciation rates in effect over the life of the above facilities and total accrued depreciation by account.
- c) Retirements, gross salvage and cost of removal by plant account in attached Gannett Fleming format.

Requested By: Jolie Mathis

Information Provided: The company provided the requested information to the MPSC staff
on January 29, 1997. No update has been prepared since that time, pursuant to the
requirements of MPSC Rule 4 CSR 240-20.030.

The attached information provided to the Missouri Public Service Commission Staff in response to the above data information request is accurate and complete, and contains no material misrepresentations or omissions, based upon present facts of which the undersigned has knowledge, information or belief. The undersigned agrees to immediately inform the Missouri Public Service Commission Staff if, during the pendency of Case No. EM-96-149 before the Commission, any matters are discovered which would materially affect the accuracy or completeness of the attached information.

If these data are voluminous, please (1) identify the relevant documents and their location (2) make arrangements with requestor to have documents available for inspection in the Ameren UE office, or other location mutually agreeable. Where identification of a document is requested, briefly describe the document (e.g. book, letter, memorandum, report) and state the following information as applicable for the particular document: name, title, number, author, date of publication and publisher, addresses, date written, and the name and address of the person(s) having possession of the document. As used in this data request the term "document(s)" includes publication of any format, workpapers, letters, memoranda, notes, reports, analyses, computer analyses, test results, studies of data, recordings, transcriptions and printed, typed or written materials of every kind in your possession, custody or control within your knowledge. The pronoun "you" or "your" refers to Ameren UE and its employees, contractors, agents or others employed by or acting in its behalf.
