Ameren Missouri TRM – Volume 2: C&I Measures Revision Log

Revision	Date	Description
1.0	05/30/2018	Initial version filed for Commission approval.
1.1	06/19/2020	Updated version to include new measures and updates to existing
		measures
2.0	10/15/2020	Updated version to include updates to existing measures.
3.0	9/15/2021	Update "Deemed Tables" with PY2020 Evaluation results plus
		updates to existing measures (lighting, chiller, pool pump). Added
		EUL lookup table for lighting measures from PY19.
4.0	9/26/2022	Updated "Deemed Tables" with PY2021 Evaluation results and
		added two new measures: 2.2.2 Compressed Air Leak Repair
		(shifting Compressed Air Nozzle and VSD Air Compressor to 2.2.3
		and 2.2.4, respectively) and 2.5.10 Chiller Tune-Up.
<u>5.0</u>	<u>10/05/2023</u>	Updated baselines to 2015 IECC (effective 1/1/2024) for 2.5.5,
		2.5.6, and 2.5.8. Updated baseline table to include only 2015 IECC
		for 2.5.7 PTAC/PTHP. Added "exterior" to 24/7 lighting
		coincidence factor because 24/7 interior lighting (e.g., exit signs) are
		included in the indoor lighting coincidence factor. Retired measures
		2.6.4 and 2.6.7 in response to the EISA backstop provision
		becoming effective 8/1/2023. Expanded measure 2.2.4 VSD Air
		Compressor description to include units up to 200-hp.

Revision 4.0<u>5.0</u>

Volume 2: Commercial and Industrial Measures

2.1 Appliances

2.1.1 Clothes Washer

DESCRIPTION

This measure relates to the installation of a commercial-grade clothes washer meeting the ENERGY STAR[®] minimum qualifications. Note it is assumed the domestic hot water (DHW) and dryer fuels of the installations are known.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The commercial-grade clothes washer must meet the ENERGY STAR[®] minimum qualifications (provided in the table below), as required by the program. The current specification is effective as of February 5, 2018.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a commercial-grade clothes washer meeting the minimum federal baseline as of January 2013. $^{\rm l}$

Efficiency Level		Top loading	Front Loading	
Baseline	Federal Standard	≥1.6 MEF, ≤8.5 WF	≥2.00 MEF, ≤5.5 WF	
Efficient	ENERGY STAR®	N/A	≥2.2 MEF, ≤4.0 IWF	

The Modified Energy Factor (MEF) includes unit operation, water heating, and drying energy use, with the higher the value the more efficient the unit; "The quotient of the capacity of the clothes container, divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load."

The Water Factor (WF) indicates the total water consumption of the unit, with the lower the value the less water required; "*The quotient of the total weighted per-cycle water consumption for cold wash, divided by the capacity of the clothes washer.*"²

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 11 years.³

MEEIA 2019-21 Plan

 ¹ See federal standard 10 CFR 431.152.
 ² Definitions provided on the Energy Star[®] website.

³ Appliance Magazine, September 2007 as referenced in ENERGY STAR[®] Commercial Clothes Washer Calculator.

DEEMED MEASURE COST

The incremental cost is assumed to be \$200.4

Loadshape – Miscellaneous BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = [(Capacity*\frac{1}{MEFbase}*Ncycles)*(\%CWbase+(\%DHWbase*\%Electric_{DHW}) + (\%Dryerbase*\%Electric_{Dryer}))] - [(Capacity*\frac{1}{MEFeff}*Ncycles)*(\%CWeff+(\%DHWeff*\%Electric_{Dryer}))] + (\%Dryereff*\%Electric_{Dryer}))]$

Where:

 = Actual - If capacity is unknown, assume 3.1 cubic feet⁵ MEFbase = Modified Energy Factor of baseline unit = Actual. If unknown, assume average values provided below. MEFeff = Modified Energy Factor of efficient unit Ncycles = Number of Cycles per year = 2190⁶ %CW = Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below) %DHW = Percentage of total energy consumption used for water heating
MEFeff= Modified Energy Factor of efficient unitNcycles= Number of Cycles per year = 21906%CW= Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below)%DHW= Percentage of total energy consumption used for water heating
Ncycles= Number of Cycles per year = 21906%CW= Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below)%DHW= Percentage of total energy consumption used for water heating
= 21906%CW= Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below)%DHW= Percentage of total energy consumption used for water heating
%CW= Percentage of total energy consumption for clothes washer operation (different for baseline and efficient unit – see table below)%DHW= Percentage of total energy consumption used for water heating
%DHWPercentage of total energy consumption used for water heating
%DHW = Percentage of total energy consumption used for water heating
(different for baseline and efficient unit – see table below)
%Dryer = Percentage of total energy consumption for dryer operation
(different for baseline and efficient unit – see table below)
%Electric _{DHW} = Percentage of DHW savings assumed to be electric
%Electric _{Dryer} = Percentage of dryer savings assumed to be electric

⁴ Based on Industry Data 2007 as referenced in ENERGY STAR® Commercial Clothes Washer Calculator.

⁵ Based on the average clothes washer volume of all units that pass the federal standard on the California Energy Commission (CEC) database of commercial clothes washer products (accessed on 11/26/2015).

⁶ Based on DOE Technical Support Document, 2009; Chapter 8 Life-Cycle Cost and Payback Period Analysis, p 8-15.

Appendix H - TRM - Vol. 2: C&I Measures

Missouri

Efficiency I evol	MEFbase and MEFee			
Efficiency Level	Top loading	Front Loading	Weighted Average ⁷	
Federal Standard	1.6	2.0	1.7	
ENERGY STAR [®]	N/A	2.2	2.2	

Efficiency Level	Percentage of Total Energy Consumption ⁸				
Efficiency Level	%CW	%DHW	%Dryer		
Federal Standard	6.5%	25.9%	67.6%		
ENERGY STAR®	3.5%	14.1%	82.4%		

DHW fuel	%Electric _{DHW}
Electric	100%
Natural Gas	0%
Deres freed	0/ Elss4

Dryer fuel	%Electric _{Dryer}
Electric	100%
Natural Gas	0%

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below.⁹

	ΔkWh			
Efficiency Level	Electric DHW		Electric DHW	
v	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR®	808.2	229.3	725.3	146.5

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

⁷ Weighted average MEF of federal standard rating for front- loading and top- loading units. Baseline weighting is based upon the relative top front loading percentage of available non-ENERGY STAR[®] commercial products in the CEC database (accessed 11/26/2015) and ENERGY STAR[®] weighting is based on eligible products as of 11/26/2015. The relative weightings are as follows, see more information in "Commercial Clothes Washer Analysis.xlsx":

Efficiency Level	Front	Тор
Baseline	37%	63%
ENERGY STAR®	99%	1%

⁸ The percentage of total energy consumption that is used for the machine, heating the hot water, or by the dryer is different depending on the efficiency of the unit. Values are based on a data provided in the ENERGY STAR[®] Calculator for Commercial Clothes Washers.

Clothes Washers. ⁹ Note that the baseline savings is based on the weighted average baseline MEF (as opposed to assuming front baseline for frontefficient unit and top baseline for top- efficient unit). The reasoning is that the support of the program of more efficient units (which are predominately front loading) will result in some participants switching from planned purchase of a top loader to a front loader.

MEEIA 2019-21 Plan

CF

Appendix H - TRM - Vol. 2: C&I Measures

Where:

ΔkWh = Energy Savings as calculated above

= Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.000137943910

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below.

	ΔkW			
Efficiency Level	Electric DHW Electric Drver		Electric DHW Gas Drver	Gas DHW Gas Drver
ENERGY STAR®	0.1115	0.0316	0.1001	0.0202

NATURAL GAS SAVINGS

 $\Delta Therms = [[(Capacity * \frac{1}{\textit{MEFbase}} * Ncycles) * ((\% DHW base * \% Natural) + (\% Natural) +$ $GasDHW*R_eff) + (\% Dryerbase*\% GasDryer\% Gas_Dryer))] - [(Capacity*\frac{1}{MEFeff}*1)] - [(Capacity*1)] - [(Capacity*\frac{1}{MEFeff}*1)] - [(Capacity*1)] - [(Cap$ Ncycles) * ((%DHWeff * %GasDHW%Natural Gas_DHW* R_eff) + (%Dryereff * %GasDryer%Gas_Dryer))]]* Therm_convert

Where:

= Percentage of DHW savings assumed to be Natural Gas %Gasphw = Recovery efficiency factor R eff $= 1.26^{11}$ %Gas_{Dryer} = Percentage of dryer savings assumed to be Natural Gas Therm convert = Conversion factor from kWh to Therm = 0.03412

Other factors as defined above.

DHW fuel	%Gas _{DHW}
Electric	0%
Natural Gas	100%

Therefore a factor of 0.98/0.78 (1.26) is applied.

MEEIA 2019-21 Plan

¹⁰ Based on Ameren Missouri 2016 Loadshape for Business Miscellaneous End-Use. Upon inspection and comparison to the residential clothes washer coincidence factor, this is a reasonable assumption until data becomes available to inform a technology specific coincidence factor. Given that business laundry schedules are likely more variable compared to residential, it follows that less overlap with the system peak hour is possible.

¹¹ To account for the different efficiency of electric and natural gas hot water heaters (gas water heater: recovery efficiencies ranging from 0.74 to 0.85 (0.78 used), and electric water heater with 0.98 recovery efficiency (http://www.energystar.gov/ia/partners/bldrs_lenders_raters/downloads/Waste_Water_Heat_Recovery_Guidelines.pdf).

Appendix H - TRM - Vol. 2: C&I Measures

Ameren Missouri

Dryer fuel	%Gas _{Dryer}
Electric	0%

Revision 4.05.0

Page 9

Appendix H - TRM - Vol. 2: C&I Measures

2.1.2 Clothes Dryer

DESCRIPTION

This measure is for the installation of a residential clothes dryer, utilized in a commercial setting, meeting the ENERGY STAR[®] criteria. ENERGY STAR[®] qualified clothes dryers save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions (such as air flow and/or heat input rate) improving air circulation through better drum design or booster fans, and improving efficiency of motors. Reducing the runtime of dryers through automatic termination by temperature and moisture sensors is believed to have the greatest potential for reducing energy use in clothes dryers.¹³ ENERGY STAR[®] provides criteria for both gas and electric clothes dryers.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Clothes dryer must meet the ENERGY STAR® criteria, as required by the program.

Definition of Baseline Equipment

The baseline condition is a clothes dryer meeting the minimum federal requirements for units manufactured on or after January 1, 2015.

Deemed Lifetime of Efficient Equipment

The expected measure life is assumed to be 14 years.¹⁴

Deemed Measure Cost

Dryer Size	Incremental Cost ¹⁵

Ventless Electric, Compact (240V) (<4.4 ft ³)	0.0428	0.0591	0.1438
Vented Gas	0.0041	0.0056	0.0136

NATURAL GAS ENERGY SAVINGS

Ameren Missouri

Natural gas savings only apply to ENERGY STAR® vented gas clothes dryers.

$$\Delta Therm = \left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff}\right) * Ncycles * Therm_convert * %Gas$$

Where:

Therm_convert = Conversion factor from kWh to Therm = 0.03413 %Gas = Percent of overall savings coming from gas = 0% for electric units and 84% for gas units²⁴

Using defaults provided above:

$$\Delta$$
Therms = (8.45/2.84 - 8.45/3.48) * Ncycles * 0.03413 * 0.84

	ΔTherms		
Product Class	Multi-family	Laundromat	On-Premise
	Multi-failing	Launuromat	Laundromat
Vented Gas	16.8	23.3	56.6

PEAK GAS SAVINGS

Savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$\Delta Therms$ $\Delta PeakTherms = _$

365.25

Where:

 $\Delta Therms = Therm impact calculated above$ 365.25 = Days per year

²⁴% Gas accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). 84% was determined using a ratio of the gas to total savings from gas dryers given by ENERGY STAR[®] Draft 2 Version 1.0 Clothes Dryers Data and Analysis.

2.2 Compressed Air

2.2.1 Compressed Air No Loss Condensate Drain

DESCRIPTION

No-loss condensate drains remove condensate as needed without venting compressed air, resulting in less air demand and better efficiency. Replacement or upgrades of existing no-loss drains are not eligible for this measure.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a no-loss condensate drain.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a standard condensate drain (open valve, timer, or both).

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of a no-loss condensate drain is assumed to be 13 years.²⁵

DEEMED MEASURE COST

The measure cost is \$700 per drain.²⁶

2.2.2 Compressed Air Leak Repair

DESCRIPTION

This measure applies to an installed air compressor that has developed leaks. Leaks in a compressed air system lead to an increase in energy use to maintain the necessary pressure in the system.

Savings are calculated by using information collected through survey and measurement of the compressed air system, including the cubic feet per minute (CFM) of the airflow of each leak using ultrasonic leak detection equipment.

DEFINITION OF EFFICIENT EQUIPMENT

Efficient Equipment is defined as the state of the air compressor system after leaks have been repaired. It is not necessarily the air compressor with no leaks left as some leaks may be impossible to reach or have substantial difficulty in fixing, therefore the efficient equipment is one that has all leaks repaired that have been stated to be repaired.

DEFINITION OF BASELINE EQUIPMENT

Baseline equipment is characterized by the condition of the compressed air system at the time of inspection before the leaks are repaired.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The effective useful life is 2 years.³⁰

DEEMED MEASURE COST

Measure cost should include the inspection and repair cost.

2.2.3 Compressed Air Nozzle

DESCRIPTION

This measure applies to the replacement of a standard air nozzle with high-efficiency air nozzle used in a compressed air system. High-efficiency air nozzles use the Coandă effect to pull in free air and use significantly less compressed air for blowing off parts or for drying. These nozzles have the added benefits of noise reduction and improved safety in systems with greater than 30 psig.

This measure was developed to be applicable to the following program types: DI and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a compressed air nozzle meeting program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a standard air nozzle.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is 15 years.³⁴

DEEMED MEASURE COST

Incremental measure costs are presented in the following table.35

Nozzle Diameter	Measure Cost
1/8"	\$42
1/4"	\$57
5/16"	\$87
1/2"	\$121

³⁸ Conservative estimate based on average values provided by the Compressed Air Challenge Training Program, Machinery's

 ²⁴ Conservative estimate based on average values provided by the Compressed Air Challenge Training Program, Machinery's Handbook 25^a Edition, and manufacturers' catalog. .
 ³⁹ Calculated based on the type of compressor control. This assumes the compressor will be between 40% and 100% capacity before and after the changes to the system demand. See "Industrial System Standard Deemed Saving Analysis.xls."
 ⁴⁰ Assumes 50% handheld air guns and 50% stationary air nozzles. Manual air guns tend to be used less than stationary air nozzles, and a conservative estimate of 1 second of blow-off per minute of compressor run time is assumed. Stationary air nozzles are commonly more wasteful as they are often mounted on machine tools and can be manually operated resulting in the possibility of a long term open blow situation. An assumption of 5 seconds of blow-off per minute of compressor run time is used.

2.2.4 VSD Air Compressor

DESCRIPTION

This measure relates to the installation of an air compressor with a variable frequency drive, load/no load controls, or variable displacement control. A baseline modulating compressor regulates output by choking off the inlet air, which is not efficient. Efficient compressors use a variable speed drive on the motor to match output to the load. Savings are calculated using representative baseline and efficient demand numbers for compressor capacities according to the facility's load shape, and the number of hours the compressor runs at that capacity. Demand curves are as per US Department of Energy (DOE) data for a Variable Speed compressor versus a Modulating compressor. This measure applies only to an individual compressor $\leq 40-200$ hp. Only one compressor per compressed air distribution system is eligible.

This measure was developed to be applicable to the following program type: TOS. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

2.3 Food Service

2.3.1 Combination Oven

DESCRIPTION

This measure applies to full or half-sized electric ENERGY STAR[®] combination ovens with a pan capacity ≥ 5 and ≤ 20 and to full or half-sized natural gas fired ENERGY STAR[®] combination ovens with a pan capacity ≥ 6 installed in a commercial kitchen. Combination ovens combine the function of hot air convection (convection mode), saturated and superheated steam heating (steam mode), and combination convection/steam mode for moist heating, to perform steaming, baking, roasting, re-thermalizing, and proofing of various food products. ENERGY STAR[®] certified combination ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified combination oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type, operation mode (steam or convection), and pan capacity.

Fuel Type	Operation	Idle Rate (Btu/hr for Gas, kW for Electric)	Cooking-Energy Efficiency (%)
Natural Gas	Steam Mode	\leq 200P+6,511	≥41
Natural Gas	Convection Mode	\leq 150P+5,425	≥ 56
Electric	Steam Mode	$\leq 0.133P+0.6400$	≥ 55
Elecuic	Convection Mode	\leq 0.080P+0.4989	≥76

ENERGY STAR[®] Requirements (Version 2.2, Effective October 7, 2015)

Note: P = Pan capacity as defined in Section 1.T of the Commercial Ovens Program Requirements Version 2.2.⁵⁴

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas combination oven that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years. 55

DEEMED MEASURE COST

https://www.energystar.gov/sites/default/files/Commercial%20Ovens%20Final%20Version%202.2%20Specification.pdf https://www.energystar.gov/sites/default/files/asset/document/commercial_kitchen_equipment_calculator.xlsx

https://www.energystar.gov/sites/default/files/asset/document/commercial_kitchen_equipment_calculator.xlsx

MEEIA 2019-21 Plan

⁵⁴ Pan capacity is defined as the number of steam table pans the combination oven is able to accommodate as per the ASTM F1495-05 standard specification.

⁵⁵ Lifetime from ENERGY STAR[®] Commercial Kitchen Equipment Savings Calculator, which cites reference as "FSTC research on available models, 2009."

The incremental capital cost for this measure is \$4,300.56

MEASURE CODE:

2.3.2 Commercial Steam Cooker

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] steam cookers installed in a commercial kitchen. Commercial steam cookers contain compartments where steam energy is transferred to food by direct contact. ENERGY STAR[®] certified steam cookers have shorter cook times, higher production rates, and reduced heat loss due to better insulation and more efficient steam delivery.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified steam cooker meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type and pan capacity.

ENERGY STAR[®] Requirements (Version 1.2, Effective August 1, 2003)

	Electric Efficien	cy Requirements	Natural Ga	s Efficiency
Pan Capacity	Idle Energy Rate	Cooking	Idle Energy Rate	Cooking
	Idle Energy Rate	Efficiency		Efficiency
3-pan	$\leq 400 \ \mathrm{W}$		≤ 6,250 Btu/hr	
4-pan	\leq 530 W	> 500/	≤ 8,350 Btu/hr	> 200/ >1/4
5-pan	$\leq 670 \text{ W}$	\geq 50%	≤ 10,400 Btu/hr	\geq 38% N/A
6-pan and larger	$\leq 800 \text{ W}$		≤ 12,500 Btu/hr	

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas steam cooker that is not ENERGY STAR $^{\circledast}$ certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.⁶⁰

DEEMED MEASURE COST

Actual incremental cost for this measure should be used. If actuals are unavailable use \$4,150.61

MEEIA 2019-21 Plan

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Custom calculation for an electric steam cooker below; otherwise use deemed value from the table that follows. 62

ΔkWh	$= (\Delta IdleEnergy + \Delta CookingEnergy) * Days/1,000$
Where:	
∆IdleEnergy	= Difference in idle energy between baseline and efficient steam cooker = [(1 – SteamMode) *(IdleRate _{Base} + SteamMode * Production _{Base} * Pans *EFOOD/Eff _{Base})* (Hours – FoodCooked/(Production _{Base} * Pans))] - [(1 – SteamMode) *(IdleRate _{ESTAR} + SteamMode * Production _{ESTAR} * Pans * EFOOD/Eff _{ESTAR})* (Hours – FoodCooked/(Production _{ESTAR} *
$\Delta CookingEnergy$	Pans))] = Difference in cooking energy between baseline and efficient steam cooker = (FoodCooked * EFOOD/ Eff _{Base}) – (FoodCooked * EFOOD/ Eff _{ESTAR})
Days	= Annual days of operation
1,000 SteamMode	 = Custom or, if unknown, use 365.25 days per year = Wh to kWh conversion factor = Time (%) in constant steam mode = Custom or, if unknown, use 40%
IdleRateBase	= Idle energy rate (W) of baseline electric steam cooker = $1,100 \text{ W}^{63}$
IdleRateestar	 = Idle energy rate (W) of ENERGY STAR[®] electric steam cooker = Custom or, if unknown, use value from table below as determined by pan capacity
ProductionBase	= Production capacity (lb/hr) per pan of baseline electric steam cooker = 23.3 lb/hr
Productionestar	= Production capacity (lb/hr) per pan of ENERGY STAR [®] electric steam cooker = Custom or, if unknown, use 16.7 lb/hr
Pans	= Pan capacity of steam cooker = Custom or, if unknown, use 6 pans
EFOOD	= ASTM energy to food

⁶² Algorithms and assumptions derived from ENERGY STAR[®] Commercial Kitchen Equipment Savings Calculator.
⁶³ Idle energy rate for baseline steam cookers is the average of rates provided by ENERGY STAR[®] for steam generator and boilerbased cookers.

2.3.3 Fryer

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] certified fryers installed in a commercial kitchen. ENERGY STAR[®] fryers offer shorter cook times and higher production rates through advanced burner and heat exchanger designs. Fry pot insulation reduces standby losses, resulting in lower idle energy rates. Standard-sized ENERGY STAR[®] fryers are up to 30% more efficient, and large-vat ENERGY STAR[®] fryers are up to 35% more efficient, than standard fryers.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified fryer meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and fryer capacity (standard versus large vat).

ENERGY STAR® Requirements	(Version 2.0, Effective A	pril 22, 2011)
---------------------------	---------------------------	----------------

Liter still inquirements	(· ersion 200, 2000 erspin 22, 2011)				
	Electric Efficiency Requirements		Natural Gas Efficiency Requirements		
Fryer Capacity	Idle Energy Rate	Cooking Efficiency Consumption	Idle Energy Rate	Cooking Efficiency Consumption	
Standard Open Deep-Fat Fryer	\leq 1,000 W	> 80%	\leq 9,000 Btu/hr	> 50%	
Large Vat Open Deep-Fat Fryer	\leq 1,100 W	≥ 8070	\leq 12,000 Btu/hr	≥ 3078	

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas fryer that is not ENERGY STAR® certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.⁷¹

DEEMED MEASURE COST

The incremental capital cost for this measure is \$210 for standard electric, \$0 for large vat electric, \$0 for standard gas, and \$1,120 for large vat gas fryers.⁷²

2.3.4 Convection Oven

DESCRIPTION

This measure applies to either full or half-sized electric ENERGY STAR[®] convection ovens and to half sized natural gas fired ENERGY STAR[®] convection ovens installed in a commercial kitchen. Convection ovens are general purpose ovens that use fans to circulate hot, dry air over the food surface. ENERGY STAR[®] certified convection ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified convection oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and oven capacity (full size versus half size).

ENERGY STAR[®] Requirements (Version 2.2, Effective October 7, 2015)

Over Conseits	Electric Efficiend	Electric Efficiency Requirements Requirements		
Oven Capacity	Idle Energy Rate	Cooking Efficiency	Idle Energy Rate	Cooking Efficiency
Full Size	\leq 1.60 kW	> 71%	≤ 12,000 Btu/hr	\geq 46%
Half Size	\leq 1.00 kW	$\geq /170$	N/A	N/A

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas convection oven that is not ENERGY STAR® certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.76

DEEMED MEASURE COST

The incremental capital cost for this measure is \$0.77

2.3.5 Griddle

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] certified griddles installed in a commercial kitchen. ENERGY STAR[®] commercial griddles achieve approximately 10% higher efficiency than standard griddles with strategies such as highly conductive or reflective plate materials and improved thermostatic controls.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be a new ENERGY STAR[®] electric or natural gas fired griddle meeting idle energy rate limits as determined by fuel type.

ENERGY STAR[®] Requirements (Version 1.2, Effective May 8, 2009 for natural gas and January 1, 2011 for electric griddles)

Electric Efficiency Requirements		Natural Gas Efficiency Requirements	
Idle Energy Rate	Cooking Efficiency Consumption	Idle Energy Rate	Cooking Efficiency Consumption
$\leq 320 \text{ W/ft}^2 \\ \leq 1.00 \text{ kW}$	Reported	\leq 2,650 Btu/hr/ft ² N/A	Reported

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas fired griddle that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.⁸¹

DEEMED MEASURE COST

The incremental capital cost for this measure is \$0 for an electric griddle and \$360 for a gas griddle. $^{\rm 82}$

MEASURE CODE:

2.3.6 Kitchen Demand Ventilation Controls

DESCRIPTION

Installation of commercial kitchen demand ventilation controls that vary the ventilation based on cooking load and/or time of day. This measure applies to the following program types: RF, NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be a control system that varies the exhaust rate of kitchen ventilation (exhaust and/or makeup air fans) based on the energy and effluent output from the cooking appliances (i.e., the more heat and smoke/vapors generated, the more ventilation needed). This involves installing a new temperature sensor in the hood exhaust collar and/or an optic sensor on the end of the hood that sense cooking conditions which allows the system to automatically vary the rate of exhaust to what is needed by adjusting the fan speed accordingly.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is kitchen ventilation that has constant speed ventilation motor.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT⁸⁶

The expected measure life is assumed to be 15 years.

MEASURE COST⁸⁶⁸⁰

The incremental capital cost for this measure is:

Measure Category	Incremental Cost (\$/HP)
DVC Control Retrofit	\$1,991
DVC Control New	\$1,991

2.3.7 Hot Food Holding Cabinet

DESCRIPTION

This measure applies to electric ENERGY STAR[®] certified hot food holding cabinets (HFHCs) installed in a commercial kitchen. ENERGY STAR[®] HFHCs achieve approximately 70% higher efficiency than standard models by incorporating better insulation which reduces heat loss, offers better temperature uniformity within the cabinet from top to bottom, and keeps the external cabinet cooler. In addition, many certified HFHCs may include additional energy saving devices such as magnetic door gaskets, auto-door closures, or dutch doors.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new ENERGY STAR[®] electric HFHC meeting idle energy rate limits as determined by product interior volume.

ENERGY STAR[®] Requirements (Version 2.0, Effective October 1, 2011)

Interior Volume (ft ³)	Idle Energy Consumption Rate (W)
0 < V < 13	\leq 21.5 V
$13 \le V < 28$	\leq 2.0 V + 254.0
$28 \le V$	\leq 3.8 V + 203.5

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric HFHC that is not ENERGY STAR® certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.91

DEEMED MEASURE COST

Actual incremental costs should be used if available. If actual costs are unknown, assume \$1,783.⁹²

MEASURE CODE:

2.3.8 Pre-Rinse Spray Valve

DESCRIPTION

Pre-rinse valves use a spray of water to remove food waste from dishes prior to cleaning in a dishwasher. More efficient spray valves use less water, thereby reducing water consumption, water heating cost, and waste water (sewer) charges. Pre-rinse spray valves include a nozzle, squeeze lever, and dish guard bumper. The primary impacts of this measure are water savings. Reduced hot water consumption saves either natural gas or electricity, depending on the type of energy the hot water heater uses.

This measure was developed to be applicable to the following program types: TOS, RF, and DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the new or replacement pre-rinse spray nozzle must use less than 1.6 gallons per minute.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment will vary based on the delivery method and is defined below:

Time of Sale	Retrofit, Direct Install
The baseline equipment is	Actual existing flow rates should be used when possible. If
assumed to be 1.6 gallons per	unknown, baseline can be assumed to be 2.23 gallons per minute.95

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS (NOTE WATER SAVINGS MUST FIRST BE CALCULATED)

 $\Delta kWH = \Delta Gallons * 8.33 * 1 * (T_{out} - T_{in}) * (1/EFF_{Elec}) / 3,413$

Where:

∆Gallons	= amount of water saved as calculated below in Water Impact Calculation
8.33	= specific mass in pounds of one gallon of water (lbm/gal)
1	= Specific heat of water: 1 Btu/lbm/°F
Tout	= Water Heater Outlet Water Temperature
	= Custom, otherwise assume $Tin + 70^{\circ}F$ temperature rise from Tin^{98}
Tin	= Inlet Water Temperature
	= Custom, otherwise assume $57.9F^{99}$
EFF _{Elec}	= Efficiency of electric water heater supplying hot water to pre-rinse spray
	valve
	=Custom, otherwise assume 97% ¹⁰⁰

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta k = \Delta kWh * CF$

Where:

- $\Delta kWh = Electric energy savings, calculated above$
- CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001998949^{101}

NATURAL GAS ENERGY SAVINGS

MEEIA 2019-21 Plan

⁹⁷Average of costs recognized by Ameren Missouri (\$85.8) and KCPL (\$100).

⁹⁸ If unknown, assume a 70 degree temperature rise from Tin per Food Service Technology Center calculator assumptions to account for variations in mixing and water heater efficiencies.

⁹⁹ Using 40" deep soil temp as a proxy at Powell Gardens SCAN site. Average by month of available data from 3/28/02–10/11/14: 12 month average is 57.898. <u>http://www.wcc.nrcs.usda.gov/nwcc/site?sitenum=2061</u>.

¹⁰⁰ This efficiency value is based on IECC 2012/2015 performance requirement for electric resistant water heaters rounded without the slight adjustment allowing for reduction based on size of storage tank.

¹⁰¹ 2016 Ameren Missouri Coincident Peak Demand Factor for Commercial Electric Cooking. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

 Δ Therms = Δ Gallons * 8.33 * 1 * (T_{out} - T_{in}) * (1/EFF_{Gas}) / 100,000

Where:

EFFGas = Efficiency of gas water heater supplying hot water to pre-rinse spray valve = Custom, otherwise assume $80\%^{102}$

Other variables as described above.

WATER IMPACT CALCULATION

$$\Delta$$
Gallons = (FLO_{base} - FLO_{eff}) * 60 * HOURS_{day} * DAYS_{year}

Where:

FLO _{base}	= Base case flow in gallons per minute (gal/min). Use actual when appropriate if available, otherwise use values in table below.
FLO _{eff}	= Efficient case flow in gallons per minute (gal/min). Use actual
	flow rate if known, otherwise use values in table below.
60	= Minutes per hour
HOURS _{day}	= Hours per day that the pre-rinse spray valve is used at the site,
	custom, otherwise use values in the table below. ¹⁰³
DAYSyear	= Days per year pre-rinse spray valve is used at the site, custom, otherwise 312 days/yr based on assumed 6 days/wk x 52 wk/yr = 312 day/yr.

Parameter	Time of Sale	Retrofit, Direct Install
FLO _{base}	1.6 gal/min ¹⁰⁴	2.23 gal/min ¹⁰⁵
FLO _{eff}	1.06 gal/min ¹⁰⁶	1.06 gal/min

Application	HOURS _{day}
Small, quick- service restaurants	1
Medium-sized casual dining restaurants	1.5
Large institutional establishments with cafeteria	3

¹⁰² IECC 2012/2015, Table C404.2, Minimum Performance of Water-Heating Equipment.

MEEIA 2019-21 Plan

¹⁰³ Hours primarily based on PG& E savings estimates, algorithms, sources (2005), Food Service Pre-Rinse Spray Valves. ¹⁰⁴ The baseline equipment is assumed to be 1.6 gallons per minute. The Energy Policy Act (EPAct) of 2005 sets the maximum flow rate for pre-rinse spray valves at 1.6 gallons per minute at 60 pounds per square inch of water pressure when tested in accordance with ASTM F2324-03. This performance standard went into effect January 1, 2006.

www1.eere.energy.gov/femp/pdfs/spec_prerinsesprayvavles.pdf. ¹⁰⁵ Verification measurements taken at 195 installations showed average pre flowrates of 2.23 gallons per minute. IMPACT AND PROCESS EVALUATION FINAL REPORT for CALIFORNIA URBAN WATER CONSERVATION COUNCIL 2004-5 PRERINSE SPRAY VALVE INSTALLATION PROGRAM (PHASE 2) (PG&E Program # 1198-04; SoCalGas Program 1200-04) ("CUWCC Report," Feb 2007).

¹⁰⁶ 1.6 gallons per minute used to be the high efficiency flow, but more efficient spray valves are available ranging down to 0.64 gallons per minute per Federal Energy Management Program which references the Food Services Technology Center web site with the added note that even more efficient models may be available since publishing the data. The average of the nozzles listed on the FSTC website is 1.06.

Appendix H - TRM – Vol. 2: C&I Measures

MEASURE CODE:

2.4 Hot Water

2.4.1 Low Flow Faucet Aerator

DESCRIPTION

This measure relates to the direct installation of a low flow faucet aerator in a commercial building. Expected applications include small business, office, restaurant, or motel. For multifamily or senior housing, the residential low flow faucet aerator should be used.

This measure was developed to be applicable to the following program type: DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be an energy efficient faucet aerator, for bathrooms rated at 1.5 gallons per minute (GPM) or less, or for kitchens rated at 2.2 GPM or less. Savings are calculated on an average savings per faucet fixture basis.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is assumed to be a standard bathroom faucet aerator rated at 2.25 GPM or more, or a standard kitchen faucet aerator rated at 2.75 GPM or more.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 9 years.¹⁰⁷

DEEMED MEASURE COST

The incremental cost for this measure is \$8.00¹⁰⁸ or program actual.

LOADSHAPE

Water Heating BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

MEEIA 2019-21 Plan

 ¹⁰⁷ Table C-6, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007. "http://neep.org/uploads/EMV%20Forum/EMV%20Studies/measure_life_GDS%5B1%5D.pdf."
 ¹⁰⁸ Direct-install price per faucet assumes cost of aerator and install time. (2011, Market research average of \$3 and assess and install time of \$5 (20min @ \$15/hr).

Note these savings are per faucet retrofitted.109

 $\Delta kWh =$ %ElectricDHW * ((GPM_{base} - GPM_{low}) / GPM_{base}) * Usage * EPG_{electric} * ISR Where: %ElectricDHW = proportion of water heating supplied by electric resistance heating (see values in table below) **GPM**_{base} = Average flow rate, in gallons per minute, of the baseline faucet "as-used" $= 1.2^{110}$ or custom based on metering studies¹¹¹ **GPM**_{low} = Average flow rate, in gallons per minute, of the low-flow faucet erator "as-used" $= 0.94^{112}$ or custom based on metering studies¹¹³ Usage = Estimated usage of mixed water (mixture of hot water from water heater line and cold-water line) per faucet (gallons per year) = If data is available to provide a reasonable custom estimate it should be used, if not use the defaults in the table below (or substitute custom information into the calculation): EPGelectric = Energy per gallon of mixed water used by faucet (electric water heater) = (8.33 * 1.0 * (WaterTemp - SupplyTemp)) / (RE_{electric} * 3412) = (8.33 * 1.0 * (90 - 57.9)) / (0.98 * 3412) = 0.0800 kWh/gal8.33 = Specific weight of water (lbs/gallon) 1.0 = Heat Capacity of water (btu/lb-F) WaterTemp = Assumed temperature of mixed water

¹⁰⁹ This algorithm calculates the amount of energy saved per aerator by determining the fraction of water consumption savings for the upgraded fixture. Due to the distribution of water consumption by fixture type, as well as the different number of fixtures in a building, several variables must be incorporated.

¹¹⁰ Representative baseline flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use.

¹¹¹ Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

¹¹² Average retrofit flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. Assumes all kitchen aerators at 2.2 gpm or less and all bathroom aerators at 1.5 gpm or less. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use. It is possible that programs installing low-flow aerators lower than the 2.2 gpm for kitchens and 1.5 gpm for bathrooms will see a lower overall average retrofit flow rate.

¹¹³ Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

MEEIA 2019-21 Plan

Page 55

¹²¹ Default assumption for unknown fuel is based on EIA Commercial Building Energy Consumption Survey (CBECS) 2012 for Midwest North Central Region (see 'HC8.9 Water Heating in Midwest Region.xls'). If utilities have specific evaluation results providing a more appropriate assumption for buildings in a particular market or geographical area, then they should be used. ¹¹⁵ Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 75%. Commercial properties are more similar to MF homes than SF homes. MF hot water is often provided by a larger commercial boiler. This suggests that the average recovery efficiency is somewhere between a typical central boiler efficiency of .59 and the .75 for single family home. An average is used for this analysis by default.

Appendix H - TRM - Vol. 2: C&I Measures

2.4.2 Circulator Pump

DESCRIPTION

Demand control recirculation pumps seek to reduce inefficiency by combining control via temperature and demand inputs, whereby the controller will not activate the recirculation pump unless both (a) the recirculation loop return water has dropped below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

This measure was developed to be applicable to the following program types: TOS, RF, and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Re-circulating pump shall cycle on based on (a) the recirculation loop return water dropping below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

DEFINITION OF BASELINE EQUIPMENT

The base case for this measure category is an existing, un-controlled recirculation pump on a gasfired Central Domestic Hot Water System.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The effective useful life is 15 years.122

DEEMED MEASURE COST

The assumed measure cost is \$1,200 per pump.¹²³

Appendix H - TRM - Vol. 2: C&I Measures

2.4.3 Heat Pump Water Heater

DESCRIPTION

This measure applies to the installation of a heat pump water heater (HPWH) in place of a standard electric water heater in a commercial building. Savings are presented dependent on the heating system installed in the building due to the impact of the heat pump water heater on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOSNC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a heat pump water heater meeting program efficiency requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is assumed to be a new, electric storage water heater meeting federal minimum efficiency standards. $^{\rm 126}$

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 13 years.127

DEEMED MEASURE COST

Actual costs should be used where available. Incremental capital costs are presented in the table below for heat pump water heaters with energy factors (EF) of 2.0 and 2.4 and rated volumes of 40 gallons and 50 gallons, respectively.¹²⁸

EF	Rated Volume (gal)	Incremental Cost
2.0	40	\$1,340.30
2.4	50	\$1,187.58

For larger HPWHs, incremental capital costs are presented below based on heating capacity.¹²⁹

Heating Capacity (MBtu/hr)	Incremental Cost
10-50	\$4,000.00
>50-100	\$7,000.00
>100-300	\$10,000.00
>300-500	\$14,000.00

¹²⁶ Federal standards for \leq 55 gallon and \leq 12 kW storage water heaters are from 10 CFR §430.32(d). Federal standards for >120 gallon and>12 kW storage water heaters are from 10 CFR §431.110. Since the federal standard effectively requires a heat pump water heater for residential electric storage water heaters >55 gallons and \leq 120 gallons, this measure excludes those units. ¹²⁷ 2010 Residential Heating Products Final Rule Technical Support Document, U.S. DOE, Table 8.7.2.

¹²⁸ Cost information is based upon data from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014. See "NR HW Heater WA017 MCS Results Matrix - Volume I August2016.xls" for more information.

 $^{^{129}}$ Costs for larger heat pump water heaters are from 2017 Michigan Energy Measures Database.xlsx and are based on heat pump water heaters with a COP \geq 3.0.

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = ((1/EF_{BASE} - 1/EF_{EE}) * HWU_{GAL} * \gamma Water * (T_{out} - T_{in}) * 1.0 * 3,412) + kWh_{COOL} - kWh_{HEAT}$

 $\label{eq:kWhcool} kWh_{COOL} = ((1-1/EF_{EE})*HWU_{GAL}*\gamma Water*(T_{out}-T_{in})*1.0*LF*53\%*LM) / (COP_{COOL}*3,412)*\% Cool$

 $kWh_{HEAT} = ((1-1/EF_{EE}) * HWU_{GAL} * \gamma Water * (T_{out} - T_{in}) * 1.0) * LF * 43\%) / (COP_{HEAT} * 3,412) * \% ElectricHeat$

Where:

kWh_cool	= Cooling savings from conversion of heat in building to water heat ¹³⁰
kWh_heat	= Heating cost from conversion of heat in building to water heat (dependent on heating fuel)
EFBASE	= Efficiency of baseline water heater according to federal standards,
	expressed as Energy Factor (EF) or Thermal Efficiency (E _t) = See table below
EFEE	= EF of heat pump water heater
	= Actual
HWUgal	= Estimated annual hot water consumption (gallons)
	= Actual if possible to provide reasonable custom estimate. If not, two methodologies are provided below to develop an estimate.
γWater	= Specific weight of water
	= 8.33 pounds per gallon
Tout	= Tank temperature
	= Actual, if unknown assume 125 °F ¹³¹
Tin	= Incoming water temperature from well or municipal system

MEEIA 2019-21 Plan

Page 59

¹³⁰ This algorithm calculates the heat removed from the air by subtracting the heat pump water heater electric consumption from the total water heating energy delivered. This is then adjusted to account for location of the heat pump unit and the coincidence of the waste heat with cooling requirements, the efficiency of the central cooling, and latent cooling demands.

¹³¹ Ideally, the actual set point of the water heater should be used. If not available, 125 degrees is provided as an estimate of unmixed output temperature. While plumbing code generally limits temperatures at the end use, it typically does not limit the water heater system, which can be anywhere in the range 120 -201 degrees. For applications such as laundry and dishwashing, health and safety regulations may require water to be initially heated to higher temperatures. Since temperature set points can vary widely, market, program, or site-specific data should be used whenever possible.

2.5.1 Small Commercial Learning Thermostats

DESCRIPTION

This measure characterizes the energy savings from the installation of a new programmable thermostat for reduced cooling and heating energy consumption through temperature set-back during unoccupied or reduced demand times as well as automatic adjustments based on occupancy patterns and various independent variables such as weather. This measure is limited to small businesses as defined by programs,¹⁴³ as they have smaller HVAC systems that are similar to residential HVAC systems and may be controlled by a simple manual adjustment thermostat. Mid-to large-sized businesses will typically have a building automation system or some other form of automated HVAC controls. This measure is only appropriate for single zone heating systems. Custom calculations are required for savings for learning thermostats installed in multi-zone systems.

This measure was developed to be applicable to the following program types: RF, DI, and TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature set-points according to various independent variables without manual intervention.

DEFINITION OF BASELINE EQUIPMENT

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change the temperature set-point.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a learning thermostat is assumed to be 10 years 144 based upon equipment life only. 145

DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown, the capital cost for this measure is assumed to be \$224.¹⁴⁶

LOADSHAPE

Cooling BUS Heating BUS

2.5.2 Small Commercial Programmable Thermostats

DESCRIPTION

This measure characterizes the energy savings from the installation of a new programmable thermostat for reduced heating and cooling energy consumption through temperature set-back during unoccupied or reduced demand times. This measure is limited to small businesses as defined by programs,¹⁴⁹ as they have smaller HVAC systems that are similar to residential HVAC systems and may be controlled by a simple manual adjustment thermostat. Mid- to large-sized businesses will typically have a building automation system or some other form of automated HVAC controls. This measure is only appropriate for single zone heating systems. Custom calculations are required for savings for programmable thermostats installed in multi-zone systems.

This measure was developed to be applicable to the following program types: RF and DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature set-points according to a schedule without manual intervention.

DEFINITION OF BASELINE EQUIPMENT

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change the temperature set-point.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a programmable thermostat is assumed to be 8 years¹⁵⁰ based upon equipment life only.¹⁵¹

DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown, the capital cost for this measure is assumed to be \$181.¹⁵²

LOADSHAPE

Cooling BUS

¹⁵¹ Future evaluation is strongly encouraged to inform the persistence of savings to further refine measure life assumption. As this characterization depends heavily upon a large scale but only 2-year study of the energy impacts of programmable thermostats, the longer-term impacts should be assessed.

2.5.3 Demand Controlled Ventilation

DESCRIPTION

Demand control ventilation (DCV) automatically adjusts building ventilation rates based on occupancy. DCV is part of a building's ventilation system control strategy. It may include hardware, software, and controls as an integral part of a building's ventilation design. Active control of the ventilation system provides the opportunity to reduce heating and cooling energy use.

The primary component is a control sensor to communicate either directly with the economizer or with a central computer. The component is most typically a carbon dioxide (CO_2) sensor, occupancy sensor, or turnstile counter. This measure is modeled to assume night time set backs are in operation and minimum outside air is being used when the building is unoccupied.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment condition is defined by new CO₂ sensors installed on return air systems where no other sensors were previously installed. Additionally, commissioned control logic and installed hardware must be capable of reducing ventilation rates based on sensor input. For heating savings, this measure does not apply to any system with terminal reheat (constant volume or variable air volume). For terminal reheat system a custom savings calculation should be used.

DEFINITION OF BASELINE EQUIPMENT

The base case for this measure is a space with no demand control capability. The current code minimum for outside air (OA) is 17 CFM per occupant (ASHRAE 62.1) which is the value assumed in this measure.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed measure life is 10 years.¹⁵⁶

DEEMED MEASURE COST

As a retrofit measure, the actual cost of installation should be used for screening. Costs should include the hardware and labor costs to install the sensors. Additional purchase and installation costs for any other component of the DCV system that was not previously existing should also be included.

Page 70

 $^{^{156}}$ Based on CO₂ sensor estimated life, determined through conversations with contractors to have a minimum lifetime of 10 years. It is recommended that they are part of a normal preventive maintenance program, as calibration is an important part of extending useful life. Although they are not subject to mechanical failure, they can fall out of tolerance over time.

Appendix H - TRM - Vol. 2: C&I Measures

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

For facilities heated by natural gas, cooling savings are:

 $\Delta kWh = SQFT_{cond} \ / \ 1000 \ * \ SF_{cooling}$

For facilities heated by heat pumps, heating and cooling savings are:

 $\Delta kWh = SQFT_{cond} / 1000 * SF_{cooling} + SQFT_{cond} / 1000 * SF_{Heat HP}$

For facilities heated by electric resistance heating and cooling savings are:

$$\Delta kWh = SQFT_{cond} / 1000 * SF_{cooling} + SQFT_{cond} / 1000 * SF_{Heat ER}$$

Where:

SQFT= Square footage of conditioned space commissioned with DCVSF= Cooling Savings Factor, including cooling and fan energy savingsSFHeat HP= Heating Savings factor for facilities heated by Heat Pump (HP)

SF_{Heat HP} = Heating Savings factor for facilities heated by Heat Pump (HP) SF_{Heat ER} = Heating Savings factor for facilities heated by Electric Resistance (ER)

Savings factors are based on Building Type and weather zone - see tables below.157

	SF _{cooling} (kWh/1000 SqFt)

¹⁵⁷ Energy savings factors were calculated using weather data and methodology consistent with ASHRAE standards. Savings are calculated on an annual basis for each given weather zone in Missouri. Original energy savings for DCV were developed for Illinois utilizing standards, inputs and approaches as set forth by ASHRAE 62.1and 90.1. These savings factors were then translated into Missouri-specific values using adjustment factors based on differences in heating and cooling degree hours. See DCV savings factors v1.xlsx for derivation.

MEASURE CODE:

2.5.4 Advanced Roof Top Unit (RTU) Controls

DESCRIPTION

A traditional packaged HVAC rooftop unit uses a zone thermostat to control the operation of the compressor or the gas furnace, depending on whether the zone thermostat is calling for cooling or heating. Under a conventional control scheme, the compressor or furnace is cycled on or off to maintain the zone thermostat set point with the supply fan operating continuously (when the building is occupied) to provide sufficient ventilation air and provide comfort heating and cooling for the space. The supply-fan speed is typically not capable of modulation, so it supplies constant air volume under all modes of operations.

Modulating the supply fan in conjunction with demand-controlled ventilation (DCV) can reduce both heating/cooling energy and fan energy requirements. This measure describes the energy savings realized by retrofitting traditional RTUs with advanced controllers that enable integrated air-side economization, supply-fan speed control (by installing a variable speed drive), and demand-controlled ventilation.

This measure is applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

A traditional RTU retrofitted and commissioned with advanced controls that allow for modulation of supply fan speed in conjunction with demand-controlled ventilation (DCV).

DEFINITION OF BASELINE EQUIPMENT

Packaged heating and cooling equipment with constant speed supply fans providing ventilation at the design rate at all times when the fan is operating and when the building is occupied.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.¹⁵⁸

DEEMED MEASURE COST

As a retrofit measure, actual costs should be specified when available. Default measure costs are listed below based on RTU supply fan horsepower rating:¹⁵⁹

Supply Fan Size ¹⁶⁰ (hp)	Controller	Installation Labor	Total Retrofit Cost
1	\$2,200	\$750	\$2,950
2	\$2,600	\$750	\$3,350

¹⁵⁸ Consistent with other HVAC variable speed drive lifetimes.

¹⁶⁰ Interpolation may be used to estimate controller cost for motor sizes not listed.

MEEIA 2019-21 Plan

Appendix H - TRM - Vol. 2: C&I Measures

3	\$3,500	\$750	\$4,250
5	\$4,000	\$750	\$4,750
7.5	\$4,142	\$750	\$4,892

LOADSHAPE HVAC BUS

IIVAC DOS

Algorithm

CALCULATION OF SAVINGS

Although advanced RTUs controls can enable operating strategies that result in heating and cooling savings, field testing has shown variable results (in some instances increased heating/cooling energy consumption has been observed). Field testing has suggested that upwards of 90% of total energy savings can be attributed to reduced fan energy requirements, and therefore the following savings estimates are limited to those relating to fan energy consumption.

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = P_{sf} * SF * Hours_{fan}$

Where:

P_{sf} = Nominal horsepower of supply fan motor

- SF = Fan energy savings factor¹⁶¹ (kWh/hour/horsepower) = 0.558
- Hours_{fan} = Annual operating hours for fan motor based on Building Type. Default hours are provided for HVAC applications by Building Type.¹⁶² When available, actual hours should be used, especially in instances where RTU operation is seasonal.

Building Type	Total Fan Run Hours
Large Office	6753
Medium Office	6968
Small Office	6626
Warehouse	6263
Stand-alone Retail	6679
Strip Mall	6687
Primary School	5906
Secondary School	6702
Supermarket	6900

¹⁶¹ Based on average field testing results outlined in Advanced Rooftop Control (ARC) Retrofit: Field-Test Results, PNNL-22656. U.S. Department of Energy, July 2013. Savings factors were consistent across the capacity range. See "RTU Control Savings.xlsx" for additional details.

¹⁶² Hours per year are estimated using the modeling results and represent the total number of hours the fans are operating for heating, cooling and ventilation for each Building Type.

2.5.5 Electric Chiller

DESCRIPTION

This measure involves the installation of a new electric chiller meeting the efficiency standards presented below. This measure could relate to the replacement of an existing unit at the end of its useful life or the installation of a new system in an existing building (i.e., time of sale). Only single-chiller applications should be assessed with this methodology. For multiple chiller projects, a custom analysis should be used to establish savings.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment is assumed to meet the <u>2015</u> <u>IECC energy</u> efficiency requirements, <u>effective January 1</u>, 2024.

Prior to January 1, 2024, the applicable baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. When local code does not exist, use of IECC 2012 is defined as the building code baseline. In most cases, this will be some version of International Energy Conservation Code (IECC). Depending on the version, this will correspond to the requirements defined within Table 503.2.3(7) in the case of IECC 2009, Table 403.2.3(7) in the case of either IECC 2012 or the IECC 2015, or Table C403.3.2(7) in the case of IECC 2018.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.163

DEEMED MEASURE COST

The incremental capital cost for this measure is \$106.23 per ton.¹⁶⁴

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = TONS * (IPLV_{BASE} - IPLV_{EE}) * EFLH$

Where:

TONS	= Chiller nominal cooling capacity in tons (note: 1 ton = 12,000 Btu/hr)
	= Actual installed
IPLV BASE	=Efficiency of baseline equipment expressed as Integrated Part Load Value
	(kW/ton). Chiller units are dependent on chiller type. See 'Chiller Units,
	Conversion Values' and 'Baseline Efficiency Values by Chiller Type' and
	Capacity in the Reference Tables section.
$IPLV_{EE^{165}}$	= Efficiency of high efficiency equipment expressed as Integrated Part Load
	Value (kW/ton) ¹⁶⁶
	= Actual installed
EFLH	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWH * CF$

Where:

1

 $\Delta kWh =$ Annual electricity savings, as calculated above

MEEIA 2019-21 Plan

¹⁶⁵ Integrated Part Load Value is a seasonal average efficiency rating calculated in accordance with ARI Standard 550/590. It may be calculated using any measure of efficiency (EER, kW/ton, COP), but for consistency, it is expressed in terms of IPLV here. ¹⁶⁶ Can determine IPLV from standard testing or looking at engineering specs for design conditions. Standard data is available from

AHRnetI.org. http://www.ahrinet.org/.

REFERENCE TABLES

Chillers Ratings - Chillers are rated with different units based on equipment type as shown below

Equipment Type	Unit
Air cooled, electrically operated	EER
Water cooled, electrically operated, positive displacement (reciprocating)	kW/ton
Water cooled, electrically operated, positive displacement (rotary screw and scroll)	kW/ton

In order to convert chiller equipment ratings to IPLV the following relationships are provided

kW/ton = 12 / EER kW/ton = 12 / (COP x 3.412) COP = EER / 3.412 COP = 12 / (kW/ton) / 3.412 EER = 12 / kW/tonEER = COP x 3.412

Baseline Efficiency Values by Chiller Type and Capacity:

Note: Efficiency requirements depend on the path (Path A or Path B) that the building owner has chosen to meet compliance requirements. For air cooled and absorption chillers, Path A should be assumed. For water cooled chillers, the building owner should be consulted and the relevant path used for calculations. When unknown, Path A should be used.

a. The requirements for centrifugal civilar shall be adjusted for nonstandard rating conditions in accordance with Section C403.3.2.1 and are only applicable for the range of conditions listed in Section C403.3.2.1. The requirements for air-cooled, water-cooled positive displacement and absorption chillers are at standard rating conditions defined in the reference test procedure.
 b. Both the full-load and IPUV requirements shall be mat or exceeded to comply with this standard. Where there is a Path B, compliance can be with either Path A or Path B for any application.
 c. NA means the requirements are not applicable for Path B and only Path A can be used for compliance.
 d. FL represents the full-load performance requirements and IPLV the part-load performance requirements.

MEASURE CODE:

MEEIA 2019-21 Plan

Appendix H - TRM - Vol. 2: C&I Measures

2.5.6 Heat Pump Systems

DESCRIPTION

This measure applies to the installation of high efficiency air-cooled, water source, ground water source, and ground source heat pump systems. This measure could apply to replacing an existing unit at the end of its useful life, or installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

For this characterization to apply, the efficient equipment is assumed to be a high-efficiency aircooled, water source, ground water source, or ground source heat pump system that exceeds both the full load and part load efficiencies associated with the applicable code described in the <u>Definition of Baseline Equipment. energy efficiency requirements specified by the building code</u> applicable to local jurisdiction, prior to January 1, 2024. This may be a version of the 2009, 2012 or 2015 International Energy Conservation Code (IECC) or ASHRAE 90.1 standard. After January 1, 2024, the applicable building code is 2015 IECC.

DEFINITION OF BASELINE EQUIPMENT

For this characterization to apply, the baseline equipment is assumed to be a standard-efficiency air- cooled, water source, ground water source, or ground source heat pump system that meets the <u>2015 IECC</u> energy efficiency requirements of local building code, effective January 1, 2024.

Prior to January 1, 2024, the applicable baseline is assumed to be similar equipment meeting the energy efficiency requirements of local building code. When local code does not exist, use of IECC 2012 is defined as the building code baseline.

The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.¹⁶⁷

DEEMED MEASURE COST

For analysis purposes, the incremental capital cost for this measure is assumed as \$100 per ton for air-cooled units.¹⁶⁸ The incremental cost for all other equipment types should be determined on a site-specific basis.

LOADSHAPE

Cooling BUS Heating BUS

Algorithm

¹⁶⁷ Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

¹⁶⁸ Based on a review of TRM incremental cost assumptions from Vermont, Wisconsin, and California.

MEEIA 2019-21 Plan

Appendix H - TRM - Vol. 2: C&I Measures

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

For units with cooling capacities less than 65 kBtu/hr:

 $\Delta kWh = Annual kWh Savings_{cool} + Annual kWh Savings_{heat}$

Annual kWh Savings_{cool} = $(kBtu/hr_{cool}) * [(1/SEER_{base}) - (1/SEER_{ee})] * EFLH_{cool}$

Annual kWh Savingsheat = (kBtu/hrheat) * [(1/HSPFbase) - (1/HSPFee)] * EFLHheat

For units with cooling capacities equal to or greater than 65 kBtu/hr:

 $\Delta kWh = Annual kWh Savings_{cool} + Annual kWh Savings_{heat}$

Annual kWh Savingscool = (kBtu/hrcool) * [(1/IEERbase) - (1/IEERee)] * EFLHcool

Annual kWh Savings_{heat} = $(kBtu/hr_{heat})/3.412 * [(1/COP_{base}) - (1/COP_{ee})] * EFLH_{heat}$

Where:

kBtu/hr _{cool}	= Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/hr).
	= Actual installed
SEER _{base}	= Seasonal Energy Efficiency Ratio of the baseline equipment
	= SEER from tables below, based on the applicable IECC.
	= For units with cooling capacity <65kbtu/hr and efficient unit is measured
	in terms of SEER2, convert SEERbase to SEER2base, if applicable code is
	based on IECC, or custom input as necessary. ¹⁶⁹
SEERee	= Seasonal Energy Efficiency Ratio of the energy efficient equipment.
	= Actual installed
EFLH _{cool}	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC
	End Use.
HSPFbase	= Heating Seasonal Performance Factor of the baseline equipment
	= HSPF from tables below, based on the applicable IECC. For units with
	cooling capacity <65kbtu/hr and efficient unit is measured in terms of
	HSPF2, convert HSPFbase to HSPF2base; if applicable code is based on IECC,
	or custom input as necessary. ¹⁷⁰
HSPF _{ee}	= Heating Seasonal Performance Factor of the energy efficient equipment.
	= Actual installed. If rating is COP, HSPF = COP * 3.413

MEEIA 2019-21 Plan

¹⁶⁹ SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting a existing system that is rated in SEER to SEER2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, and efficient case must be expressed in the same metrics (e.g., both SEER or SEER2 before applying formulas.
¹⁷⁰ HSPF to HSPF2 conversion factor: HSPF2 = HSPF2 = K 87%. Conversion factor for HSPF to HSPF2 is used when converting a property of the property

^{1/0} HSPF to HSPF2 conversion factor: HSPF2 = HSPF x 87%. Conversion factor for HSPF to HSPF2 is used when converting a existing system that is rated in HSPF to HSPF2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. Th efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both HSPF or HSPF2 before applying formulas.

Ameren Missou	i Appendix H - TRM – Vol. 2: C&I Measures
EFLH _{heat}	= Heating mode equivalent full load hours are provided in section 2.7 HVAC End Use.
IEER _{base}	= Integrated Energy Efficiency Ratio of the baseline equipment
	= IEER from tables below, based on the applicable IECC.
IEER _{ee}	 = Integrated Energy Efficiency Ratio of the energy efficient equipment. = Actual installed
kBtu/hr _{hea}	= Capacity of the heating equipment in kBtu per hour.= Actual installed
3.412	= Btu per Wh.
COPbase	= Coefficient of performance of the baseline equipment = COP from tables below, based on the applicable IECC. If rating is HSPF, COP = HSPF / 3.413. If rating is HSPF2, COP2 = HSPF * 87% / 3.413
COPee	= Coefficient of performance of the energy efficient equipment.= Actual installed

2.5.7 Packaged Terminal Air Conditioner (PTAC) - Packaged Terminal Heat Pump (PTHP)

DESCRIPTION

A PTAC is a packaged terminal air conditioner that cools and provides heat through an electric resistance heater (heat strip). A PTHP is a packaged terminal heat pump. A PTHP uses its compressor year-round to heat or cool. In warm weather, it efficiently captures heat from inside a space and pumps it outside for cooling. In cool weather, it captures heat from outdoor air and pumps it into a space, adding heat from electric heat strips as necessary to provide heat.

This measure characterizes:

- 1) Time of Sale: the purchase and installation of a new efficient PTAC or PTHP.
- 2) Early Replacement: the early removal of an existing PTAC or PTHP from service, prior to its natural end of life, and replacement with a new efficient PTAC or PTHP unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life. The measure is only valid for non-fuel switching installations for example replacing a cooling only PTAC with a PTHP can currently not use the TRM.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be PTACs or PTHPs that exceed baseline efficiencies.

DEFINITION OF BASELINE EQUIPMENT

TOS: the baseline conditions is <u>in provided in</u> the <u>2015 IECC building code</u>, which is summarized <u>in the Federal Baseline baseline</u> reference table provided below. EREP: the baseline is the existing PTAC or PTHP for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.¹⁷¹

Remaining life of existing equipment is assumed to be 5 years.¹⁷²

DEEMED MEASURE COST

TOS: The incremental capital cost for this equipment is estimated to be \$84/ton.¹⁷³

MEEIA 2019-21 Plan

¹⁷¹ Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007
¹⁷² Standard assumption of one third of effective useful life.

¹⁷³ DEER 2008. This assumes that baseline shifts between IECC versions carries the same incremental costs. Values should be verified during evaluation

Appendix H - TRM – Vol. 2: C&I Measures

EREP: The measure cost is the full cost of removing the existing unit and installing a new one. The actual program cost should be used. If unknown assume 1,047 per ton.¹⁷⁴

The assumed deferred cost (after 5 years) of replacing existing equipment with new baseline unit is assumed to be \$1,039 per ton.¹⁷⁵ This cost should be discounted to present value using the utilities' discount rate.

LOADSHAPE

Cooling BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Electric savings for PTACs and PTHPs should be calculated using the following algorithms

ENERGY SAVINGS

TOS:

PTAC ΔkWh^{176}	$= \Delta k W h_{cool}$
-------------------------	-------------------------

PTHP ΔkWh	$= \Delta k W h_{cool} + \Delta k W h_{heat}$
ΔkWh_{cool}	= kBtu/hr _{cool} * (1/EER _{base} - 1/EER _{ee}) * EFLH _{cool}
ΔkWh_{heat}	$= kBtu/hr_{heat} / 3.412 * (1/COP_{base} - 1/COP_{ee}) * EFLH_{heat}$

EREP:

 ΔkWh for remaining life of existing unit (1st 5years)

ΔkWh	$= \Delta k W h_{cool} + \Delta k W h_{heat}$
ΔkWh_{cool}	= kBtu/hr _{cool} * (1/EER _{exist} - 1/EER _{ee}) * EFLH _{cool}
ΔkWh_{heat}	= kBtu/hr _{heat} / $3.412 * (1/COP_{exist} - 1/COP_{ee}) * EFLH_{heat}$
∆kWh for remain	ning measure life (next 10 years)
ΔkWh	$= \Delta k W h_{cool} + \Delta k W h_{heat}$
ΔkWh_{cool}	= kBtu/hr _{cool} * $(1/EER_{base} - 1/EER_{ee})$ * EFLH _{cool}
ΔkWh_{heat}	= kBtu/hr _{heat} / $3.412 * (1/COP_{base} - 1/COP_{ee}) * EFLH_{heat}$

Where:

¹⁷⁶ There are no heating efficiency improvements for PTACs since although some do provide heating, it is always through electric resistance and therefore the COPbase and COPee would be 1.0.

MEEIA 2019-21 Plan

¹⁷⁴ Based on DCEO – IL PHA Efficient Living Program data.

¹⁷⁵ Based on subtracting TOS incremental cost from the DCEO data and incorporating inflation rate of 1.91%.

kBtu/hr _{cool}	= Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/hr).
	= Actual installed
EFLHcool	
EFLHcool	= Equivalent Full Load Hours for cooling are provided in section 2.7
FFII	HVAC End Use
EFLHheat	= Equivalent Full Load Hours for heating are provided in section 2.7
	HVAC End Use
EERexist	= Energy Efficiency Ratio of the existing equipment
	= Actual. If unknown assume 8.1 EER^{177}
EER _{base}	= Energy Efficiency Ratio of the baseline equipment.
	= See the table below for requirements based on 2015 IECC.the Code
	of Federal Regulations. Note the compliance data is applicable to the
	date of manufacture, and not the date of purchase. where local code is
	based on IECC. Content is based on tables 503.3.3(3) (IECC 2009) and
	C403.2.3(3) (IECC 2012, 2015): Minimum Efficiency Requirements:
	Electrically operated packaged terminal air conditioners, packaged
	terminal heat pumps. An alternate, custom input may be necessary for
	jurisdictions recognizing alternative code.
EERee	= Energy Efficiency Ratio of the energy efficient equipment. For air-
	cooled units < 65 kBtu/hr, if the actual EERee is unknown, assume the
	following conversion from SEER to EER for calculation of peak
	savings: 178 EER = (-0.02 * SEER ²) + (1.12 * SEER)
	= Actual installed
kBtu/hrbart	= Capacity of the heating equipment in kBtu per hour.
KESter/III heat	= Actual installed
3.412	= Btu per Wh.
COP _{exist}	= Coefficient of performance of the existing equipment
COPexist	= Actual. If unknown assume 1.0 COP for PTAC units and 2.6 COP^{179}
COD	for PTHPs.
COPbase	= Coefficient of performance of the baseline equipment; see table
COD	above <u>below</u> for values.
COPee	= Coefficient of performance of the energy efficient equipment.
	= Actual installed

Page 98

2.5.8 Single-Package and Split System Unitary Air Conditioner

DESCRIPTION

This measure promotes the installation of high-efficiency unitary air-, water-, and evaporatively cooled air conditioning equipment, both single-package and split systems. Air conditioning (AC) systems are a major consumer of electricity and systems that exceed baseline efficiencies can save considerable amounts of energy. This measure could apply to the replacement of an existing unit at the end of its useful life or the installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be a highefficiency air-, water-, or evaporatively cooled air conditioner that exceeds both the full load and part-load <u>efficiencies associated with the applicable code described in the Definition of Baseline</u> <u>Equipment_energy efficiency requirements specified by the building code applicable to local</u> jurisdiction, prior to January 1, 2024. This may be a version of the 2009, 2012 or 2015 IECC or ASHRAE 90.1 standard. After January 1, 2024, the applicable building code is 2015 IECC.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment is assumed to be a standardefficiency air-, water, or evaporatively cooled air conditioner that meets the <u>2015 IECC</u> energy efficiency requirements-<u>of local building code</u>, <u>effective January 1</u>, 2024.

Prior to January 1, 2024, the applicable baseline is assumed be similar equipment meeting the energy efficiency requirements of local building code. When local code does not exist, use of IECC 2012 is defined as the building code baseline.

The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.180

DEEMED MEASURE COST

The incremental capital cost for this measure is assumed to be \$100 per ton.¹⁸¹

LOADSHAPE

Cooling BUS

Algorithm

MEEIA 2019-21 Plan

¹⁸⁰ Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

¹⁸¹ Based on a review of TRM incremental cost assumptions from Vermont, Wisconsin, and California. This assumes that baseline shift from between IECC versions carries the same incremental costs. Values should be verified during evaluation.

Appendix H - TRM - Vol. 2: C&I Measures

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

For units with cooling capacities less than 65 kBtu/hr:

 $\Delta kWH = kBtu/hr * (1/SEERbase - 1/SEERee) * EFLH$

For units with cooling capacities equal to or greater than 65 kBtu/hr:

 $\Delta kWH = kBtu/hr * (1/IEERbase - 1/IEERee) * EFLH$

Where:

kBtu/hr	= Capacity of the cooling equipment actually installed in kBtu per hour (1 ton
	of cooling capacity equals 12 kBtu/hr)
SEERbase	= Seasonal Energy Efficiency Ratio of the baseline equipment
	= SEER values from tables below, based on the applicable IECC.
	= For units with cooling capacity <65kbtu/hr and efficient unit is measured in
	terms of SEER2, convert SEERbase to SEER2base. ¹⁸² , if applicable code is based
	on IECC, or custom input as necessary.
SEERee	= Seasonal Energy Efficiency Ratio of the energy efficient equipment (actually
	installed)
IEER _{base}	= Integrated Energy Efficiency Ratio of the baseline equipment
	= IEER values from tables below, based on the applicable IECC, if applicable
	code is based on IECC, or custom input as necessary.
IEERee	= Integrated Energy Efficiency Ratio of the energy efficient equipment
	(actually installed.)
EFLH	= Equivalent Full Load Hours for cooling are provided in section 2.7 HVAC
	End Use

¹⁸² SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting an existing system that is rated in SEER to SEER2. This is to meet the DOE MI CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both SEER or SEER2) before applying formulas.

MEEIA 2019-21 Plan

2.5.9 High Volume Low Speed Fans

DESCRIPTION

The measure applies to 20-24 foot diameter horizontally mounted ceiling high volume low speed (HVLS) fans that are replacing multiple non HVLS fans that have reached the end of useful life.

This measure was developed to be applicable to the following program types: TOS and RF If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be classified as HVLS and have a VFD.¹⁸³

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline condition is assumed to be multiple non HVLS existing fans that have reached the end of useful life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.

DEEMED MEASURE COST

The incremental capital cost for the fans are as follows: $\frac{183}{174}$

Fan Diameter Size (feet)	Incremental Cost
20	\$4150
22	\$4180
24	\$4225

LOADSHAPE HVAC BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS¹⁸³¹⁷⁴

The annual electric savings from this measure are deemed values depending on fan size and apply to all building types:

¹⁸³ "Illinois Statewide Technical Reference Manual for Energy Efficiency Version 8.0, Volume 2: Commercial and Industrial Measures," Section 4.1.2, High Volume Low Speed Fans.

2.5.10 Chiller Tune Up

DESCRIPTION

This measure is the tune-up of an existing air-cooled or water-cooled electric chiller. The tune-up consists of tube cleaning, chilled and condenser water temperature adjustments, and reciprocating compressor unloading switch adjustments.

DEFINITION OF EFFICIENT EQUIPMENT The efficient condition is an existing chiller post tune-up.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is an existing chiller prior to receiving the tune-up.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected lifetime of the measure is 5 years.

DEEMED MEASURE COST

The incremental cost for this measure varies. Use actual cost.

DEEMED O&M COST ADJUSTMENTS

There are no expected O&M cost adjustments for this measure.

BASELINE EFFICIENCY VALUES BY CHILLER TYPE AND CAPACITY

Refer to 2012 IECC Minimum Efficiency Requirements in Reference Tables section of this measure.

LOADSHAPE

Cooling BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS¹⁸⁵

 $\Delta kWh = TONS * IPLVBASE * EFLH * ESF$

Where:

1

tu/hr)
ad Value
Units,
pe' and
on.
ng type,

¹⁸⁵ "Indiana Technical Reference Manual Version 2.2," Page 217.

MEEIA 2019-21 Plan

Revision 4.05.0

Appendix H - TRM - Vol. 2: C&I Measures

For example, energy savings for the tune-up of a 350-ton chiller with an IPLV of .540kW/Ton serving a Medium Office in St Louis is calculated as:

 $\Delta kWh = TONS * IPLV BASE * EFLH * ESF = 350 * .540 * 1386 * 0.08 = 20,956 kWh$

SUMMER COINCIDENT PEAK DEMAND SAVINGS¹⁸⁶

 $\Delta kW = \Delta kWh * CF$

Where:

 $\Delta kWh =$ Electric energy savings, as calculated above

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor for Cooling (0.0009106840)

For example, demand reduction for the tune-up of the above chiller resulting in 20,956 kWh of energy savings is calculated as:

$$\Delta kW = 20,956 \text{ kWh} * 0.0009106840 = 19.08 \text{ kW}$$

NATURAL GAS ENERGY SAVINGS

Reference Tables

Chillers Ratings - Chillers are rated with different units based on equipment type as shown below

Equipment Type	Unit
Air cooled, electrically operated	EER
Water cooled, electrically operated, positive displacement (reciprocating)	kW/ton
Water cooled, electrically operated, positive displacement (rotary screw and scroll)	kW/ton

In order to convert chiller equipment ratings to IPLV the following relationships are provided:

kW/ton	= 12 / EER
kW/ton	$= 12 / (COP \times 3.412)$
COP	= EER / 3.412

¹⁸⁶ Indiana Technical Reference Manual Version 2.2," Page 219.

MEEIA 2019-21 Plan

Appendix H - TRM - Vol. 2: C&I Measures

COP	= 12 / (kW/ton) / 3.412
EER	= 12 / kW/ton
EER	$= COP \times 3.412$

 C

40°F. b. Compliance with this standard can be obtained by meeting the minimum requirements of Path A or B. However, both the full load and IPLV shall be met to fulfill the requirements of the referenced standard contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.

¹⁸⁷ Note: Efficiency requirements depend on the path (Path A or Path B) that the building owner has chosen to meet compliance requirements. For air cooled and absorption chillers, Path A should be assumed. For water cooled chillers, the building owner should be consulted, and the relevant path used for calculations. When unknown, Path A should be used.

¹⁸⁸ Fixtures hours-of-use are based upon schedule assumptions used in the computer models. Nonresidential Average is a weighted average of indoor spaces using the relative area of each Building Type in the region (CBECS). These values are references in cases where the project-specific hours are unknown.

¹⁸⁹ The Waste Heat Factor for Energy is developed using computer models for the various Building Types. Exterior and garage values are 1, unknown is a weighted average of the other Building Types.

¹⁹⁰ Electric heat penalty assumptions are based on converting the IFTherm multiplier value into kWh and then applying relative heating system efficiencies. The gas efficiency was assumed to be 80% AFUE, electric resistance is assumed to be 100%, Heat Pump is assumed to be 2.3 COP.

¹⁹¹ IFTherms value is developed using computer models consistent with methodology for Waste Heat Factor for Energy.

Revision 4.0<u>5.0</u>

Appendix H - TRM - Vol. 2: C&I Measures

2.6.1 Fluorescent Delamping

DESCRIPTION

This measure entails the permanent removal of an existing 4-foot or 8-foot T8 lamp and the associated lamp holders and ballasts from the fixture. Customers are responsible for determining whether or not to use reflectors in combination with lamp removal in order to maintain adequate lighting levels. Lighting levels are expected to meet the Illuminating Engineering Society of North America (IESNA) recommended light levels. Unused lamps, lamp holders, and ballasts must be permanently removed from the fixture and disposed of in accordance with local regulations.

This measure was developed to be applicable to RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition will vary depending on the existing fixture and number of lamps removed, however for the purposes of this measure, savings are defined on a per removed lamp basis. The retrofit wattage (efficient condition) is therefore assumed to be zero.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a T8 lamp with default wattages provided below.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 11 years.192

DEEMED MEASURE COST

Actual incremental costs should be used if available. For default values, see table below.

Measure	Cost
8-Foot Lamp Removal	\$16.00
4-Foot Lamp Removal	\$12.00
8-Foot Lamp Removal with reflector	\$30.00
4-Foot Lame Removal with reflector	\$25.00

LOADSHAPE

Lighting BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS¹⁹³

 $\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * WHF_{e}$

192 KCP&L measure life assumption.

¹⁹³ The savings numbers are for the straight lamp removal measures, as well as the lamp removal and install reflector measures.

MEEIA 2019-21 Plan

Revision 4.05.0

Appendix H - TRM - Vol. 2: C&I Measures

Where:

WattsBase	= Wattage reduction of lamp removed. Custom input; otherwise, use values in the table below.
Wattsee	= 0
Hours	= Average annual lighting hours of use as provided by the customer.
	If unknown, the default value based on Building Type may be
	selected from the Lighting Reference Table in Section 2.6.
WHFe	= Waste heat factor for energy to account for cooling energy savings
	from light removal is selected from the Lighting Reference Table in
	Section 2.6 for each Building Type. If building is un-cooled, the
	value is 1.0 and if unknown use C&I Average value.
ISR	= In Service Rate, 100% since permanent removal is assumed.

T8 Lamp Size	Wattage ¹⁹⁴
8-ft T8	38.6
4-ft T8	19.4

Heating Penalty

If electrically heated building:195

 $\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$

Where:

 IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta k = \Delta kWh * CF$

CF

Where:

= Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635

NATURAL GAS ENERGY SAVINGS

MEEIA 2019-21 Plan

¹⁹⁴ Default wattage reduction is based on averaging the savings from moving from a 2 to 1, 3 to 2 and 4 to 3 lamp fixture, as provided in the Standard Performance Contract Procedures Manual: Appendix B: Table of Standard Fixture Wattages (<u>http://www.sce.com/NR/rdonlyres/7A3455F0-A337-439B-9607-10A016D32D4B/0/spc_B_Std_Fixture_Watts.pdf</u>). An adjustment is made to the T8 delamped fixture to account for the significant increase in ballast factor that can be expected when delamping fixtures with parallel ballasts. See "Delamping calculation.xlsx" for details.
¹⁹⁵ Negative value because this is an increase in heating consumption due to the efficient lighting.

Heating Penalty if fossil fuel heated building (or if heating fuel is unknown):196

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

Other factors as defined above.

N/A

MEASURE CODE:

MEEIA 2019-21 Plan

¹⁹⁶ Negative value because this is an increase in heating consumption due to the efficient lighting.

2.6.2 High Performance and Reduced Wattage T8 Fixtures and Lamps

DESCRIPTION

This measure applies to High Performance T8 (HPT8) lamp/ballast systems that have higher lumens per watt than standard T8 systems. This measure applies to the installation of new equipment with efficiencies that exceed that of the equipment that would have been installed following standard market practices and is applicable to time of sale as well as retrofit measures. Retrofit measures may include new fixtures or relamp/reballast measures. In addition, options have been provided to allow for the "Reduced Wattage T8 lamps" or RWT8 lamps that result in relamping opportunities that produce equal or greater light levels than standard T8 lamps while using fewer watts.

This measure was developed to be applicable to the following program types: TOS, RF, and DI. If applied to other program types, the measure savings should be verified.

The measure applies to all commercial HPT8 installations excluding new construction and major renovation or change of use measures (see lighting power density measure). Lookup tables have been provided to account for the different types of installations. Whenever possible, actual costs and hours of use should be utilized for savings calculations. Default new and baseline assumptions have been provided in the reference tables. Default component costs and lifetimes have been provided for O&M calculations. Please see the Definition Table to determine applicability for each program. HPT8 configurations not included in the TRM may be included in custom program design using the provided algorithms as long as energy savings is achieved.

The following table defines the applicability for different programs:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
This measure relates to the installation of new equipment with efficiency that exceeds that of equipment that would have been installed following standard market practices. In general, the measure will include qualifying high- efficiency, low ballast-factor ballasts paired with high-efficiency, long- life lamps as detailed in the attached tables. High-bay applications use this system paired with qualifying high ballast factor ballasts and high performance 32 w lamps. Custom lighting designs can use qualifying low, normal or high ballast-factor ballasts and qualifying lamps in lumen equivalent applications where total system wattage is reduced when calculated using the calculation of savings algorithms.	This measure relates to the replacement of existing equipment with new equipment with efficiency that exceeds that of the existing equipment. In general, the retrofit will include qualifying high efficiency low- ballast factor ballasts paired with high efficiency long life lamps as detailed in the attached tables. Custom lighting designs can use qualifying low, normal or high-ballast factor ballasts and qualifying lamps in lumen equivalent applications where total system wattage is reduced when calculated using the calculation of savings algorithms. High-efficiency troffers (new/or retrofit) utilizing HPT8 technology can provide even greater savings. When used in a high-bay application, high performance T8 fixtures can provide equal light to HID high-bay fixtures, while using fewer watts; these systems typically utilize high ballast-factor ballasts, but qualifying low and normal ballast factor ballasts may be used when appropriate light levels are provided and overall wattage is reduced.

MEEIA 2019-21 Plan

Revision 4.05.0

Appendix H - TRM - Vol. 2: C&I Measures

DEFINITION OF EFFICIENT EQUIPMENT

This characterization assumes the efficient condition for all applications are qualifying HP or RWT8 fixture and lamp/ballast combinations listed on the CEE website under qualifying HP T8 products197 and qualifying RWT8 products.198

The definition of efficient equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
High-efficiency troffers combined with high	High-efficiency troffers (new or retrofit kits)
efficiency lamps and ballasts allow for fewer	combined with high efficiency lamps and ballasts
lamps to be used to provide a given lumen output.	allow for fewer lamps to be used to provide a given
High-efficiency troffers must have a fixture	lumen output. High efficiency troffers must have a
efficiency of 80% or greater to qualify.	fixture efficiency of 80% or greater to qualify.
High bay fixtures must have fixture efficiencies	High bay fixtures will have fixture efficiencies of
of 85% or greater.	85% or greater.

DEFINITION OF BASELINE EQUIPMENT

The definition of baseline equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
The baseline is standard efficiency T8	The baseline is the existing system.
systems that would have been installed. The baseline for high-bay fixtures is pulse start metal halide fixtures.	In July 14, 2012, federal standards were enacted that were expected to eliminate T12s as an option for linear fluorescent fixtures. However, due to significant loopholes in the legislation, T12 compliant product is still freely available.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed lifetime of efficient equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)
Fixture lifetime is 15 years. ¹⁹⁹	Fixture lifetime is 15 years.
Fixture retrofits which utilize RWT8 lamps have a lifetime	Note, since the fixture lifetime is
equivalent to the life of the lamp, capped at 15 years. There is	deemed at 15 years, the replacement
no guarantee that a reduced wattage lamp will be installed at	cost of both the lamp and ballast
time of burnout, but if one is, savings will be captured in the	should be incorporated into the O&M
RWT8 measure below.	calculation.
RWT8 lifetime is the life of the product, at the reported	
operating hours (lamp life in hours divided by operating hours

Heating Penalty

If electrically heated building:²⁰¹

$$\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

Where:

 $\label{eq:IFkwh} IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.$

SUMMER COINCIDENT DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635

NATURAL GAS SAVINGS

Heating Penalty if fossil fuel heated building (or if heating fuel is unknown):²⁰¹⁴⁹²

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each Building Type.

²⁰² Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy Efficiency (CEE) Commercial Lighting Qualifying Product Lists. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline and efficient measure cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. See "HPT8 TRM Reference Tables.xlsx" for more information and specific product links. Currently, 25WT8 are not considered under this measure as their lower light trade off and limitations on temperature and dimming have caused most distributers/contractors to use 28W almost exclusively in other markets.

Appendix H - TRM - Vol. 2: C&I Measures

2.6.3 LED Bulbs and Fixtures

DESCRIPTION

The installation of Light-Emitting Diode (LED) lighting systems have comparable luminosity to incandescent bulbs and equivalent fluorescent lamps at significantly less wattage, lower heat, and with significantly longer lifetimes.

This measure provides savings assumptions for a variety of efficient lighting fixtures including internal and external LED fixtures, recess (troffer), canopy, and pole fixtures as well as refrigerator and display case lighting.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, all LED fixtures are assumed to be ENERGY STAR[®] labeled or on the Design Light Consortium qualifying fixture list.²⁰³

LED Fixtures and Retrofit Kits with Network Controls achieve additional savings similar to the savings described in the Occupancy Controls section.

DEFINITION OF BASELINE EQUIPMENT

For TOS and RF installations, the baselines efficiency case is project specific and is determined using actual fixture types and counts from the existing space. The existing fluorescent fixture end connectors and ballasts must be completely removed to qualify.

Where the installation technology is not known, the assumed baselines condition for an outdoor pole/arm, wall-mounted, garage/canopy fixture and high-bay luminaire with a high intensity discharge light source is a metal halide fixture. Deemed fixture wattages are provided in reference tables at the end of this characterization.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

Actual incremental costs should be used if available. For default values, refer to the reference tables below.

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * WHF_e * ISR$

Where:

WattsBas	 Actual wattage of the existing or baseline system. Reference the "LED New and Baseline Assumptions" table for default values.
Wattsee	= Actual wattage of LED fixture purchased / installed. If unknown, use default provided in "LED New and Baseline Assumptions."
Hours	= Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6 by Building Type. If hours or Building Type are unknown, use the C&I Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Lighting Reference Table in Section 2.6 for each Building Type. If building is un-cooled, the value is 1.0.
ISR	= In Service Rate represents the percentage of reported lamps or fixtures that is installed and operating and varies with the program delivery approach. Use 100% for programs with direct installation and/or installation verification procedures (e.g., verification inspections for a sample of projects); use 98.7% for program delivery without installation verification. ²⁰⁴ The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

Note that LED Fixtures and Retrofit Kits with Network Controls achieve additional savings similar to the savings described in the Occupancy Controls section.

Heating Penalty:

If electrically heated building:205

 $\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$

Where:

MEEIA 2019-21 Plan

Revision 4.05.0

²⁰⁴ ISR is based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015 and consistent with other program ISR in neighboring states (Illinois and Iowa). These evaluation results are from a retail-based lighting program with multiple delivery channels including point-of-sale markdown, online website, coupons, and social marketing distribution. ²⁰⁵ Negative value because this is an increase in heating consumption due to the efficient lighting.

Appendix H - TRM - Vol. 2: C&I Measures

IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0001899635 for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for <u>exterior</u> 24/7 lighting

NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts.²⁰⁶ This factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

	LED Surface & Suspended Linear Fixture, > 7500 lumens	95.4	Т5НО 3L-F54T5НО - 4'	180.0	\$374

²⁰⁷ Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy Efficiency (CEE) Commercial Lighting Qualifying Product Lists alongside past Efficiency Vermont projects and PGE refrigerated case study. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. Efficient cost data comes from 2012 DOE "Energy Savings Potential of Solid-State Lighting in General Illumination Applications," Table A.1. See "LED Lighting Systems TRM Reference Tables.xlsx" for more information and specific product links.

Revision 4.0<u>5.0</u>

2.6.4 LED Screw Based Omnidirectional Bulb (Retired, effective 8/1/2023)

DESCRIPTION

LEDs lighting systems convert electricity to light and emit more lumens per watt when compared to baseline EISA incandescent, halogen, or compact fluorescent lamps.

This specific characterization provides savings assumptions for LED lamps that replace standard screw-in connections (e.g., A-Type lamp) such as interior/exterior omnidirectional bulb options.

This characterization assumes that the LED is installed in a commercial location. This is, therefore, appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the residential versus nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W in 2013 and 60W and 40W in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new LED screw-based lamps must be ENERGY STAR[®] qualified based upon the ENERGY STAR[®] specification v2.0 which will become effective on 1/2/2017 (https://www.energystar.gov/sites/default/files/Luminaires%20V2%200%20Final.pdf).

Qualification could also be based or on the Design Light Consortium's qualified product list.209

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent.²¹⁰ A midlife adjustment example is provided but not applied to measures installed prior to 2022.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

MEEIA 2019-21 Plan

Revision 4.05.0

²⁰⁹ https://www.designlights.org/QPL

²¹⁰ A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

Appendix H - TRM - Vol. 2: C&I Measures

Actual incremental costs should be used if available. If unavailable, assume \$3.26 (baseline cost of \$1.80 and efficient cost of \$5.06).²¹¹

LOADSHAPE

Lighting BUS Ext Lighting BUS Miscellaneous BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * WHF_e * ISR$

Where:

WattsBase	= Based on lumens of LED bulb installed
$Watts_{EE}$	= Actual wattage of LED purchased/installed. If unknown, use default provided below. ²¹²
Hours	= Average hours of use per year as provided by the customer or selected from the Lighting Reference Table in Section 2.6 and based upon Building Type. If unknown, use the C&I Average value.
WHFe	= Waste heat factors for energy to account for cooling energy savings from efficient lighting are provided for each Building Type in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.
ISR	= In-Service Rate represents the percentage of reported lamps or fixtures that is installed and operating and varies with the program delivery approach. Use 100% for programs with direct installation and/or installation verification procedures (e.g., verification inspections for a sample of projects); use 98.7% for program delivery

MEEIA 2019-21 Plan

²¹¹ Incandescent/halogen and LED cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016

Appendix H - TRM – Vol. 2: C&I Measures

Lower Lumen Range	Upper Lumen Range	Watts _{Base}	Watts _{EE} LED	Delta Watts
250	309	25	4.0	21
310	749	29	6.7	22.3
750	1,049	43	10.1	32.9
1,050	1,489	53	12.8	40.2
1,490	2,600	72	17.4	54.6
2,601	3,000	150	43.1	106.9
3,001	3,999	200	53.8	146.2
4,000	6,000	300	76.9	223.1

without installation verification.²¹³ The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

Mid-Life Baseline Adjustment Example

During the lifetime of a standard omnidirectional LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. Since the baseline bulb changes to a CFL equivalent in 2020 due to the EISA backstop provision (except for <310 and 2600+ lumen lamps), the annual savings claim must be reduced within the life of the measure to account for this baseline shift. This reduced annual savings will need to be incorporated in to cost effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

For example, for 43W equivalent LED lamp installed in 2016, the full savings (as calculated above in the Algorithm) should be claimed for the first four years, but a reduced annual savings (calculated energy savings above multiplied by the adjustment factor in the table below) should be claimed for the remainder of the measure life.^{214&215}

²¹⁵ Calculated with EISA requirement of 45lumens/watt.

MEEIA 2019-21 Plan

²¹³ ISR is based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. This value takes into account the time-delay of when bulbs are installed over subsequent program years. The reported ISR is based on the net present value (NPV) of the savings over 4 year installation period from the PY15 bulbs, discounted back to Year 1 at 6.95% (utility discount rate). These evaluation results are from a retail-based lighting program with multiple delivery channels including point-of-sale markdown, online website, coupons, and social marketing distribution.
²¹⁴ These adjustments should be applied to kW and gas impacts as well.

Appendix H - TRM - Vol. 2: C&I Measures

Lower Lumen Range	Upper Lumen Range	Mid Lumen Range	Watts EE	WattsBase before EISA 2020	Delta Watts before EISA 2020	WattsBase after EISA 2020 ²⁰⁸	Delta Watts after EISA 2020	Mid Life adjustment (in 2020) to first year savings
250	309	280	4.0	25	21	25	21	100.0%
310	749	530	6.7	29	22.3	9.4	2.7	12.1%
750	1049	900	10.1	43	32.9	13.4	3.3	10.0%
1050	1489	1270	12.8	53	40.2	18.9	6.1	15.2%

2,550	3,000	2,775	43.1	150	106.9	150	106.9	100.0%
3,001	3,999	3,500	53.8	200	146.2	200	146.2	100.0%
4,000	6,000	5,000	76.9	300	223.1	300	223.1	100.0%

Heating Penalty:

If electrically heated building:216

$$\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

Where:

$$\label{eq:IFkWh} \begin{split} &= \text{Lighting-HVAC Interaction Factor for electric heating impacts; this} \\ & \text{factor represents the increased electric space heating requirements due to} \\ & \text{the reduction of waste heat rejected by the efficient lighting. Values are} \\ & \text{provided in the Lighting Reference Table in Section 2.6 and based upon} \\ & \text{Building Type. If unknown, use the C&I Average value.} \end{split}$$

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta k = \Delta kWh * CF$

Where:

CF

Summer peak coincidence demand (kW) to annual energy (kWh) factor
0.0001899635 for indoor lighting
0.0000056160 for exterior lighting
0.0001379439 for <u>exterior</u> 24/7 lighting

NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):²¹⁶²⁰⁷

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

²¹⁶ Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

MEEIA 2019-21 Plan

Revision 4.05.0

Page 135

Appendix H - TRM - Vol. 2: C&I Measures

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon Building Type. If unknown, use the C&I Average value.

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the falling EISA-Qualified backdrop provision, an equivalent annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. The key assumptions used in this calculation are documented below:²¹⁷

Incandescent / Halogen	CFL	LED ALamp
\$1.80	\$2.20	\$5.06

The present value of replacement lamps and annual levelized replacement costs using utilities' average real discount rate of 6.91% are presented below:

Location	PV of repl	acement costs	for period	Levelized annual replacement cost savings			
Location	2016 - 2017	2017 - 2018	2018 - 2019	2016 - 2017	2017 - 2018	2018 - 2019	
C&I Average	\$18.66	\$14.70	\$10.46	\$2.04	\$1.60	\$1.14	

Note: incandescent lamps in lumen range <310 and >2600 are exempt from EISA. For these bulb types, an O&M cost should be applied as follows. If unknown Building Type, assume C&I Average:

MEEIA 2019-21 Plan

²¹⁷ All cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016 (http://mahttp://ma.eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study_FINAL_01FEB2016.pdfeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study_FINAL_01FEB2016.pdf), p.19.

MEASURE CODE:

MEEIA 2019-21 Plan

Revision 4.05.0

²¹⁸ Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA-qualified halogen/incandescent is 1000 hours (manufacturers are simply using a regular incandescent lamp with halogen fill gas rather Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC)).
²¹⁹ Incandescent/halogen cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016 (http://ma-eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study_FINAL_01FEB2016.pdf), p.19.

Appendix H - TRM - Vol. 2: C&I Measures

2.6.5 T5 Fixtures and Lamps

DESCRIPTION

T5 HO lamp/ballast systems have greater lumens per watt than a typical T8 system. The smaller lamp diameter of the T5HO also increases optical control efficiency and allows for more precise control and directional distribution of lighting. These characteristics make it easier to design light fixtures that can produce equal or greater light than standard T8 or T12 systems, while using fewer watts. In addition, when lighting designers specify T5 HO lamps/ballasts, they can use fewer luminaries per project, especially for large commercial projects, thus increasing energy savings further.²²⁰

The main markets served by T5 HO fixtures and lamps include retrofit in the commercial and nonresidential sector, specifically industrial, warehouse, and grocery facilities with higher ceiling heights that require maximum light output.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The definition of the efficient equipment is T5 HO high-bay (>15ft mounting height) fixtures with 3, 4, 6, or 8-lamp configurations.

DEFINITION OF BASELINE EQUIPMENT

The definition of baseline equipment varies based on number of lamps in a fixture and is defined in the baseline reference table at the end of this characterization. The default baseline is assumed to be a PulseStart Metal Halide fixture.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed lifetime of the efficient equipment fixture is 15 years.²²¹

DEEMED MEASURE COST

Actual costs should be used if available. If not available, \$10/lamp and \$37.50/ballast can be used to account for installation labor costs.

Revision 4.05.0

²²⁰ Lighting Research Center. T5 Fluorescent Systems. <u>http://www.lrc.rpi.edu/programs/nlpip/lightingAnswers/lat5/abstract.asp</u> ²²¹ Focus on Energy Evaluation "Business Programs: Measure Life Study" Final Report, August 9, 2009, prepared by PA Consulting Group.

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * WHF_e * ISR$$

Where:

- Watts_{Base} = Custom input. If unknown, input wattage of the baseline system is dependent on new fixture configuration and found in the 'T5HO Efficient and Baseline Wattage and Cost Assumptions' reference table below.
 Watts_{EE} = Custom Input. If unknown, input wattage depends on new fixture configuration (number of lamps) and ballast factor and number of fixtures. Value can be selected from the 'T5HO Efficient and Baseline Wattage and Cost Assumptions' reference table below.
 Hours = Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6 as annual operating hours, by Building Type. If hours or Building Type are unknown, use the C&I Average value.
 WHFe = Waste heat factor for energy to account for cooling energy savings from efficient
- lighting is selected from the Lighting Reference Table in Section 2.6 for each Building Type. If building is un-cooled, the value is 1.0.
- ISR = In Service Rate represents the percentage of reported lamps or fixtures that is installed and operating and varies with the program delivery approach. Use 100% for programs with direct installation and/or installation verification procedures (e.g., verification inspections for a sample of projects); use 98% for program delivery without installation verification.²²² The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

Heating Penalty:

If electrically heated building:²²³

$$\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

Where:

IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

SUMMER COINCIDENT DEMAND SAVINGS

 $\Delta k = \Delta k W h * CF$

MEEIA 2019-21 Plan

Revision 4.05.0

²²² Based upon review of PY5-6 evaluations from ComEd, IL commercial lighting program (BILD).
²²³ Negative value because this is an increase in heating consumption due to the efficient lighting.

Appendix H - TRM - Vol. 2: C&I Measures

Where:

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0001899635 for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for <u>exterior</u> 24/7 lighting

NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown): 224

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

DEEMED O&M COST ADJUSTMENT CALCULATION

See reference tables for different cost assumptions for lamps and ballasts. When available, actual costs and hours of use should be used.

2.6.6 LED Exit Sign

This measure characterizes the savings associated with installing a new LED exit sign (or retrofit kit) in place of a CFL or incandescent exit sign in a commercial building. LED exit signs use less power (\leq 5 watts), have a significantly longer lifetime, and have less maintenance costs compared to incandescent or CFL exit signs.²²⁸

This measure applies to the following program types: RF and DI.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is an LED exit sign with an input power demand of 5 watts or less.²²⁹

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is the existing exit sign (either a CFL or incandescent unit).

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

Actual program delivery costs should be used if available. If not, use the full cost of \$39²³⁰ for a new LED exit sign and \$25 for a retrofit kit, plus \$6.25 in labor,²³¹ for a total measure cost of \$45.25 and \$31.25, respectively.

DEEMED O&M COST ADJUSTMENT CALCULATION

The annual O&M cost adjustment savings should be calculated using the following component costs and lifetimes.

Component	Baseline Measure		
Component	Cost ²³⁸	Life (yrs) ²³⁹	
CFL lamp	\$8.91	0.63 years	
Incandescent lamp	\$7.39	0.14 years	

MEASURE CODE:

MEEIA 2019-21 Plan

²³⁷ Negative value because this is an increase in heating consumption due to the efficient lighting.

²³⁸ Includes cost of labor and new replacement bulb. Labor cost of \$6.25 based on 15 minutes (including portion of travel time) and \$25 per hour, which is in line with the typical prevailing wage of a General Laborer, as per the Annual Wage Order No. 23 published by the Missouri Department of Labor. Cost of new 7W CFL bulb is \$2.66, from Itron "2010-2012 WO017 Ex Ante Measure Cost Study Final Report." Prepared for California Public Utilities Commission, May 27, 2014.

²³⁹ ENERGY STAR[®] "Save Energy, Money and Prevent Pollution with LED Exit Signs" states that CFL bulbs for exit signs typically have an average rated life of 5,000-6,000 hours. Given 24/7 run time, assume a CFL in an exit sign will require replacement every 0.63 years (5,500 hours/8,766 hours).

2.6.7 LED Specialty Lamp (Retired, effective 8/1/2023)

DESCRIPTION

This characterization provides savings assumptions for LED directional, decorative, and globe lamps. This characterization assumes that the LED is installed in a commercial location. This is therefore appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the EISA requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new lamps must be ENERGY STAR[®] labeled based upon the ENERGY STAR[®] specification v2.0 which will become effective on 1/2/2017.<u>https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2</u>0%20 Revised%20AUG-2016.pdf). Qualification could also be based on the Design Light Consortium's qualified product list.²⁴⁰

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

MEEIA 2019-21 Plan

Revision 4.05.0

²⁴⁶ Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA qualified Halogen/ Incandescent is 1000 hours. The manufacturers are simply using a regular incandescent lamp with halogen fill gas rather than Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC).
²⁴⁷ Incandescent costs based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014.

Appendix H - TRM - Vol. 2: C&I Measures

2.6.8 Lighting Power Density

DESCRIPTION

This measure entails the installation of efficient lighting systems in either new construction or during substantial renovation of commercial buildings that triggers compliance with code. This methodology applies to situations where code specifies maximum lighting power density allowances (W/ft²). Either the Building Area Method or Space-by-Space (not recognized by IECC 2009) method as defined in IECC 2009, 2012, 2015, 2018 can be used for calculating the Interior Lighting Power Density (LPD).²⁴⁸ The measure consists of a design that has a lower LPD than code requires.

This measure was developed to be applicable to the following program types: NC and TOS. The measure is application for any project for which the project requires compliance with building code. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the lighting system must be more efficient than the baseline energy code maximum lighting power density in watts/square foot for either the interior space or exterior space.

DEFINITION OF BASELINE EQUIPMENT

The baseline is assumed to be the maximum lighting power density that meets the building code recognized by the local jurisdiction. For illustrative purposes in this characterization, IECC 2009, 2012, 2015, and 2018, are highlighted to demonstrate the methodology.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

The actual incremental cost over a baseline system should be collected from the customer if possible or quantified using an alternative suitable source.

Algorithm

CALCULATION OF SAVINGS

MEEIA 2019-21 Plan

Revision 4.05.0

²⁴⁸ Refer to the referenced code documents for specifics on calculating lighting power density using either the whole building method (IECC) or the Space by Space method (ASHRAE 90.1).

Appendix H - TRM - Vol. 2: C&I Measures

ENERGY SAVINGS

$$\Delta kWh = \frac{WSF_{Base} - WSF_{EE}}{1000} * SF * Hours * WHF_{e}$$

Where:

WSF _{base} WSF _{EE}	 Baseline lighting watts per square foot or linear foot as determined by building or space type. IECC example whole building analysis values are presented in the Reference Tables below.²⁴⁹ The actual installed lighting watts per square foot or linear foot.
SF	= Provided by customer based on square footage of the building area applicable to the lighting design for new building.
Hours	= Annual site-specific hours of operation of the lighting equipment collected from the customer or selected from the Reference Table in Section 2.8 if unavailable.
WHFe	= Waste Heat Factor for Energy to account for cooling savings from efficient lighting is as provided in the Reference Table in Section 2.8 for each Building Type. If building is not cooled, the value is 1.0.

Heating Penalty

If electrically heated building: 250

$$\Delta kWh_{heatpenalty} = \frac{WSF_{Base} - WSF_{EE}}{1000} * SF * Hours * (-IF_{kWH})$$

Where:

 IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635 for indoor lighting = 0.0000056160 for exterior lighting

= 0.0001379439 for <u>exterior</u> 24/7 lighting

Other factors as defined above.

For smaller, hand-carried items	0.58		

a. In cases where both a common space type and a building area specific space type are listed, the building area specific space type thall apply b. A 'Facility for the Visually Impaired' is a facility that is licensed or will be licensed by local or state authorities for senior long-term care, adult daycare, senior support or people with special visual needs.

MEEIA 2019-21 Plan

Revision 4.05.0

The exterior lighting design will be based on the building location and the applicable "Lighting Zone" as defined in IECC 2015 Table C405.5.2(1) which follows. This table is identical to IECC 2012 Table C405.6.2(1) and IECC 2009 Table 505.6.2(1).

LIGHTING ZONE	DESCRIPTION
1	Developed areas of national parks, state parks, forest land, and rural areas
2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use and residential mixed-use areas
3	All other areas not classified as lighting zone 1, 2 or 4
4	High-activity commercial districts in major metropoli- tan areas as designated by the local land use planning authority

TABLE C405.5.2(1)
EXTERIOR LIGHTING ZONES

The lighting power density savings will be based on reductions below the allowable design levels as specified in IECC 2009 Table 505.6.2(2), IECC 2012 Table C405.6.2(2) or IECC 2015 Table C405.5.2(2).

Revision 4.0<u>5.0</u>

Appendix H - TRM - Vol. 2: C&I Measures

2.6.9 Metal Halide Fixtures and Lamps

DESCRIPTION

This measure involves the installation of high efficiency pulse start metal halide fixtures and lamps in place of a standard metal halide. Pulse start metal halide luminaires produce more lumens per watt and have an improved lumen maintenance compared to standard probe start technology. Similarly, the high efficiency pulse start metal halide ballast lasts longer than a standard system due to their cooler operating temperatures.²⁵³

This measure was developed to be applicable for the following program type: RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is an EISA-compliant pulse start metal halide lamp and ballasts for luminaires. Under 2009 federal rulings metal halide ballasts in low-watt options (150W-500W fixtures) must be pulse start and have a minimum ballast efficiency of 88%.²⁵⁴ Amendments made in 2014 require more stringent energy conservations standards with compliance required by February 10, 2017.²⁵⁵

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is the existing bulb and fixture. If unknown assume, High Intensity Discharge (HID) Metal Halide lighting with probe start fixture and a standard ≤ 400 Watt lamp.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 15 years.²⁵⁶

DEEMED MEASURE COST

Actual costs should be used when available. If unknown, cost is assumed to be \$267.257

LOADSHAPE

Lighting BUS

²³⁹ The revised 2014 efficiency standards for metal halides require that luminaires produced on or after February 10, 2017, must not contain a probe-start metal halide ballast. Exceptions to this ruling include, metal halide luminaires with a regulated-lag ballast that utilize an electronic ballasts which operates at 480V and those which utilize a high-frequency (≥1000Hz) electronic ballast. Department of Energy – 10 CFR Part 431 – Energy Conservation Program: Energy Conservation Standards for Metal Halide Lamp Fixtures; Final Rule 7746 Federal Register / Vol. 79, No. 27 / Monday, February 10, 2014 / Rules and Regulations https://www.federalregister.gov/articles/2014/02/10/2014-02356/energy-conservation-program-energy-conservation-standardsformetal-halide-lamp-fixtures/fh-9

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * WHF_e * ISR$$

Where:

Watts _{Base}	= Input wattage of the existing system which depends on the baseline fixture configuration (number and type of lamp). Value can be selected from the reference table at the end of the characterization or a custom value can be used.
Wattsee	= New Input wattage of EE fixture, which depends on new fixture configuration. Value can be selected from the appropriate reference table at the end of the characterization, or a custom value can be used.
Hours	 Average annual lighting hours of use as provided by the customer or selected from the Lighting Reference Table in Section 2.6. If hours or Building Type are unknown, use the C&I Average value.
WHFe	 Waste heat factor for energy to account for cooling energy savings from efficient lighting is selected from the Reference Table in Section 2.8 for each Building Type. If building is un-cooled, the value is 1.0.
ISR	= In Service Rate is assumed to be 100%

Heating Penalty:

 IF_{kWh}

If electrically heated building:²⁵⁸

$$\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

Where:

= Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

SUMMER COINCIDENT DEMAND SAVINGS

MEEIA 2019-21 Plan

Revision 4.05.0

²⁵⁸ Negative value because this is an increase in heating consumption due to the efficient lighting.

CF

Appendix H - TRM - Vol. 2: C&I Measures

$\Delta kW = \Delta kWh * CF$

Where:

∆kWh = as calculated above.

- = Summer peak coincidence demand (kW) to annual energy (kWh) factor
 - = 0.0001899635 for indoor lighting
 - = 0.0000056160 for exterior lighting
 - = 0.0001379439 for exterior 24/7 lighting

NATURAL GAS SAVINGS 259

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IFTherms = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each Building Type.

Revision 4.0<u>5.0</u>

2.6.10 Occupancy Lighting Sensor Controls

DESCRIPTION

Occupancy sensors are devices that reduce lighting levels by turning lights on or off in response to the presence (or absence) of people in a defined area. Associated energy savings depends on the Building Type, location area covered, type of lighting and activity, and occupancy pattern.²⁶³

This measure relates to the installation of interior occupancy sensors on new fixtures in an existing lighting system. Lighting control types covered by this measure include remote-mounted and fixture mounted. It does not cover automatic photo sensors, time clocks, and energy management systems. All sensors must be hard wired and control interior lighting.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

It is assumed that this measure characterization applies to only fixture-mounted occupancy sensors and remote mounted occupancy sensors.

DEFINITION OF BASELINE EQUIPMENT

The baseline efficiency case assumes lighting fixtures with no occupancy controls.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for all lighting controls is assumed to be 10 years.²⁶⁴

DEEMED MEASURE COST

When available, the actual cost of the measure shall be used. When not available, the following default values are provided:

Lighting control type	Cost ²⁶⁵
Full cost of fixture mounted occupancy sensor	\$45
Full cost of remote (ceiling) mounted occupancy sensor	\$105

2.6.11 Street Lighting

DESCRIPTION

This measure characterizes the savings associated with LED street lighting conversions where a LED fixture replaces a high-intensity discharge (HID) outdoor lighting system, including metal halide, high pressure sodium, and mercury vapor. LED street lights provide considerable benefits compared to HID lights, including:

- Improved nighttime visibility and safety through better color rendering, more uniform light distribution and elimination of dark areas between poles.
- Reduced direct and reflected uplight which are the primary causes of urban sky glow.
- 40-80% energy savings (dependent on incumbent lighting source).
- 50-75% street lighting maintenance savings.²⁶⁹

This measure includes LED fixture housings including cobrahead and post-top and is applicable only where utility tariffs support LED street lighting conversions.

This measure was developed to be applicable for a one-to-one RF opportunity only.270

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment must be an LED fixture that meets the United Illuminating Rate Schedule, alongside all other luminary performance requirements, based on site characteristics²⁷¹ and all local, state and federal codes.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is the existing lighting system – a metal halide, high pressure sodium, or mercury vapor outdoor lamp, ballast, and fixture.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 12.5 years.272

DEEMED MEASURE COST

MEEIA 2019-21 Plan

²⁶⁹ See NEEP "LED Street Lighting Assessment and Strategies for the Northeast and Mid-Atlantic," January 2015, and the Municipal Solid State Street Lighting Consortium for more information

http://www1.eere.energy.gov/buildings/ssl/consortium.html 270 Many light fixtures were placed in service 20-50 years ago and may no longer service their intended purpose. It is important to conduct a comprehensive assessment of lighting needs with a lighting professional when considering a LED street lighting project. LED street lighting can result in removal of lighting altogether as LED lights provide better CRI and lighting levels than existing HID lighting types. While this measure only characterizes a one-to-one replacement value, it is recommended that this measure be updated following a Missouri assessment to see where LED street lighting has resulted in the removal of street lighting to ensure additional savings calculations are captured. Recommend using Street and Parking Facility Lighting Retrofit Financial Analysis Tool developed by DOE Municipal Solid-State Street Lighting Consortium and the Federal Energy Management Program. ²⁷¹ See DOE Municipal Solid-State Street Lighting Consortium "Model Specifications for LED Roadway Luminaires v.2.0," July 2014.

²⁷² The measure lifetime is calculated using 4,000 annual hours of use from Ameren Missouri "Light Emitting Diode (LED) Street and Area Lighting Report," July 2013 and a typical LED streetlight lifetime of 50,000 hours from Massachusetts Department of Energy Resources "LED Streetlights: What is Your Plan? (webinar)," September 11, 2013.

Appendix H - TRM – Vol. 2: C&I Measures

Actual measure installation cost should be used, including material and labor.273 If the actual cost of the LED unit is unknown, use the default values for typical LED streetlight retrofits provided below.274

Light output								
	Low (<50W) Med (50W-100W) High (>10					>100W)		
Fixture Type	min	max	min	max	min	max		
Decorative/Post Top	\$350.00	\$615.00	\$550.00	\$950.00	\$750.00	\$1,450.00		
Cobrahead	\$99.00	\$225.00	\$179.00	\$451.00	\$310.00	\$720.00

2.7.2 Computer Power Management Software

DESCRIPTION

Computer power management software is installed on a network of computers. This is software which monitors and records computer and monitor usage, as well as allows centralized control of computer power management settings.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is defined by the requirements listed below:

- Allow centralized control and override of computer power management settings of workstations which include both a computer monitor and CPU (i.e. a desktop or laptop computer on a distributed network).
- Be able to control on/off/sleep states on both the CPU and monitor according to the network
 administrator-defined schedules and apply power management policies to network groups.
- Have capability to allow networked workstations to be remotely wakened from powersaving mode (e.g. for system maintenance or power/setting adjustments).
- Have capability to detect and monitor power management performance and generate energy savings reports.
- Have capability to produce system reports to confirm the inventory and performance of equipment on which the software is installed.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF **BASELINE EQUIPMENT**

Baseline is defined as a computer network without software enforcing the power management capabilities in existing computers and monitors.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is 4 years.²⁸⁶

DEEMED MEASURE COST

The deemed measure cost is \$29 per networked computer, including labor.287

2.7.3 Heat Pump Pool Heater

DESCRIPTION

This measure applies to the installation of a heat pump pool heater in place of a standard electric pool heater on an outdoor pool at a commercial location.

This measure was developed to be applicable to the following program type: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new heat pump pool heater meeting program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new, standard efficiency electric resistance pool heater.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.²⁹²

DEEMED MEASURE COST

The incremental equipment cost difference between an electric resistance pool heater and a heat pump pool heater is \$1,000 per unit.²⁹³

LOADSHAPE

Miscellaneous BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = Q_{PoolHeating}^* (1/Eff_{Base} - 1/Eff_{EE})$

Where:

Q_{PoolHeating} = Required annual heat transfer to pool water (kWh), calculated as follows:²⁹⁴ For an uncovered pool: [53.075 * (SQFT)] + 1631.1 For a pool that is regularly covered when not in use: [8.079 * (SQFT)] + 1295.4 Where SQFT is the total surface area of the pool.

²⁹³ Measure cost based on "The Definitive Guide to Heating Your Swimming Pool," AquaCal, July 2013. Electric resistance pool heaters can be purchased for less than \$2,000, and heat pump pool heaters cost between \$2,000 and \$4,000.

MEEIA 2019-21 Plan

²⁹² Measure life is for a high-efficiency pool heater, from 2017 Michigan Energy Measures Database.

²⁹⁴ Based on the results of a swimming pool energy calculation tool found at <u>http://noanderson.com/services/swimming-poolenergy-temperature-calculator/energy-temperature-calculator/</u>. Results use St. Louis weather-related assumptions and assume a pool season of May through October (per Energy Star[®] guidelines), with a water temperature of 80 degrees Fahrenheit.

2.8 Motors

2.8.1 Motors

DESCRIPTION

This measure applies to the one-for-one replacement of an old, working or failed/near failure 1-350 horsepower, constant speed, uniformly loaded HVAC fan or pumping motor with a new motor of the same rated horsepower that meets or exceeds National Electrical Manufacturers Association (NEMA) Premium efficiency levels.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new motor that meets or exceeds NEMA Premium efficiency levels.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment efficiency is the efficiency of the existing motor, or if unknown, the federal minimum required efficiency is assumed.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.²⁹⁸

DEEMED MEASURE COST

Actual incremental costs should be used if available. If actual costs are unknown, use default installed cost from table below.²⁹⁹

Motor Size (HP)	Installed Cost
1	\$730
1.5	\$725
2	\$800

MEEIA 2019-21 Plan

³⁰² Hours per year are estimated using the eQuest models as the total number of hours the heating or cooling system is operating for each Building Type. "Heating and Cooling Run Hours" are estimated as the total number of hours fans are operating for heating, cooling and ventilation for each Building Type. This may over claim certain applications (e.g. pumps) and so where possible actual hours should be used for these applications.
³⁰³ Since savings will be constant and without fluctuation over the period of operation, demand savings are simply the energy

³⁰³ Since savings will be constant and without fluctuation over the period of operation, demand savings are simply the energy savings divided by the hours of operation. Demand savings are expected to coincide with peak demand period definitions, consistent with assumptions in VFD measures on HVAC pumps and fans.

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

MEASURE CODE:

2.8.2 Pool Pump

DESCRIPTION

This measure applies to the installation of a variable frequency drive (VFD) on an existing singlespeed pool pump at a commercial location. VFDs save energy by reducing the speed of the pool pump motor to match the pool's required flow rate. Additionally, VFD's soft-starting extends motor life by reducing wear.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF **E**FFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new VFD meeting program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is an existing, single-speed pool pump without a VFD or other motor control device.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.³⁰⁴

DEEMED MEASURE COST

Actual costs (equipment and labor) should be used if available. If actual costs are unknown, assume equipment costs of \$200/motor horsepower and labor cost of $$46.^{305}$

2.8.4 Pump Optimization

DESCRIPTION

Pump improvements can be done to optimize the design and control of centrifugal water pumping systems, including water solutions with freeze protection up to 15% concentration by volume. Other fluid and gas pumps cannot use this measure calculation. The measurement of energy and demand savings for commercial and industrial applications will vary with the type of pumping technology, operating hours, efficiency, and existing and proposed controls. Depending on the specific application slowing the pump, trimming or replacing the impeller may be suitable options for improving pumping efficiency. Pumps up to 40 HP are allowed to use this energy savings calculation. Larger motors should use a custom calculation (which may result in larger savings than this measure would claim).

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is proven to be an optimized centrifugal pumping system meeting the applicable program efficiency requirements:

- Pump balancing valves no more than 15% throttled; and
- Balancing valves on at least one load 100% open.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment is assumed to be the existing pumping system including existing controls and sequence of operations.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.³⁰⁸

DEEMED MEASURE COST

The incremental capital cost for this measure can vary considerably depending upon the strategy employed to achieve the required efficiency levels and should be determined on a site-specific basis.

2.8.5 Variable Frequency Drives for Pumps and Fans on Hydronic HVAC Systems

DESCRIPTION

This measure applies to VFDs installed on HVAC chilled water distribution pumps, hot water distribution pumps, condenser water pumps and cooling tower fans. Back-up pumps/fans do not qualify for this measure. There is a separate measure for HVAC supply and return fans. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The VFD is applied to a pump or fan motor that does not have a VFD. The hydronic system that the VFD is applied to must have a variable or reduced load. Installation is to include the necessary control points and parameters (example: differential pressure, differential temperature, return water temperature) as determined by a qualified engineer.

DEFINITION OF **BASELINE EQUIPMENT**

The time of sale baseline is a new motor installed without a VFD or other methods of control. Retrofit baseline is an existing motor operating as is.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.³¹²

DEEMED MEASURE COST

Customer-provided costs will be used when available. Default measure costs are listed below for 1 to 75 HP motors.³¹³ The average of the values below is \$179/HP.

HP	Cost
1-9 HP	\$1,874
10-19 HP	\$2,967
20-29 HP	\$4,060
30-39 HP	\$5,154
40-49 HP	\$6,247
50-59 HP	\$7,340
60-69 HP	\$8,433

³¹² Consistent with Ameren Missouri program assumptions.

³¹³ Average costs observed by other Midwestern states energy efficiency programs – specific data reflects results from Iowa program costs.

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = BHP / EFFi * Hours * ESF$

Where:

BHP	= System Brake Horsepower
	= Nominal motor HP * Motor load factor)
	Motors are assumed to have a load factor of 65% for calculating kW if
	actual values cannot be determined.314 Custom load factor may be
	applied if known.
EFFi	= Motor efficiency, installed. Actual motor efficiency shall be used to
	calculate kW. If not known, a default value of 93% is an appropriate
	assumption.
Hours	= Default hours are provided for HVAC applications which vary by
	HVAC application and Building Type. ³¹⁵ When available, actual hours
	should be used.
ESF	= Energy savings factor varies by VFD application. Units are kW/HP.

MEEIA 2019-21 Plan

³¹⁴ Del Balso, Ryan J. "Investigation into the Reliability of Energy Efficiency/Demand Side Management Savings Estimates for Variable Frequency Drives in Commercial Applications," University of Colorado, Department of Civil, Environmental and Architectural Engineering, 2013.

Architectural Engineering, 2013. ³¹⁵ Hours per year are estimated using the eQuest models as the total number of hours the heating or cooling system is operating for each Building Type. "Heating and Cooling Run Hours" are estimated as the total number of hours fans are operating for heating, cooling and ventilation for each Building Type. This may over claim certain applications (e.g. pumps) and so where possible actual hours should be used for these applications.

2.8.6 Variable Frequency Drives for HVAC Supply and Return Fans

DESCRIPTION

This measure applies to VFDs installed on HVAC supply fans and return fan. Back-up fans do not qualify for this measure. There is a separate measure for HVAC Pumps. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure is applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The VFD is applied to an HVAC fan motor that does not have a VFD. The air distribution system must have a variable or reduced load, and installation is to include the necessary control point as determined by a qualified engineer (example: differential pressure, temperature, or volume). Savings are based on the application of VFDs to a range of baseline system conditions, including no control, inlet guide vanes, outlet guide vanes, relief dampers, and throttling valves.

DEFINITION OF BASELINE EQUIPMENT

The TOS baseline is a new motor installed without a VFD or other methods of control. The RF baseline is an existing motor operating as is. RF baselines may or may not include guide vanes, throttling valves, or other methods of control.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.³¹⁸

DEEMED MEASURE COST

Customer provided costs will be used when available. Default measure costs are listed below for up to 100 hp motors.³¹⁹ The average of the values below is \$168/HP.

HP	Cost
1-9 HP	\$1,874
10-19 HP	\$2,967
20-29 HP	\$4,060
30-39 HP	\$5,154
40-49 HP	\$6,247
50-59 HP	\$7,340
60-69 HP	\$8,433
70-79 HP	\$9,526
80-89 HP	\$10,620

³¹⁸ Consistent with Ameren Missouri program assumptions.

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS³²⁰

 $\Delta kWh_{fan} = kWh_{Base} - kWh_{Retrofit}$

 $\Delta kWh_{total} = \Delta kWh_{fan} * (1 + IE_{energy})$

$$kWh_{Base} = 0.746 * HP * \frac{LF}{\eta_{moto}}) * RHRS_{base} \sum_{0.0\%}^{100\%} (\%FF * PLR_{Retrofit})$$
$$kWh_{Retrofit} = 0.746 * HP * \frac{LF}{\eta_{moto}}) * RHRS_{base} \sum_{30\%}^{100\%} (\%FF * PLR_{Retrofit})$$

Where:

ΔkWh_{fan}	= Fan-only annual energy savings
ΔkWh_{total}	= Total project annual energy savings
kWh _{Base}	= Baseline annual energy consumption (kWh/yr)
kWh _{Retrofit}	= Retrofit annual energy consumption (kWh/yr)
0.746	= Conversion factor for HP to kWh
HP	= Nominal horsepower of controlled motor
LF	= Load Factor; Motor Load at Fan Design CFM (Default = 65%) ³²¹
ηmotor	= Installed nominal/nameplate motor efficiency
	= Actual. If unknown, default can be assumed as a NEMA Premium
	Efficiency, ODP, 4-pole/1800 RPM fan motor, with efficiency indicated in
	the table below.
RHRS _{Base}	= Annual operating hours for fan motor based on Building Type.
%FF	= Percent of time at flow fraction
PLR _{Base}	= Part load ratio for a given flow fraction range based on the baseline flow
	control type (see table below)
PLR _{Retrofit}	= Part load ratio for a given flow fraction range based on the retrofit flow control type (see table below)

2.9 Refrigeration

2.9.1 Commercial Solid and Glass Door Refrigerators & Freezers

DESCRIPTION

This measure applies to ENERGY STAR[®] vertical closed and horizontal closed refrigerators or freezers installed in a commercial kitchen. ENERGY STAR[®] commercial refrigerators and freezers are more energy efficient because they are designed with components such as ECM evaporator and condenser fan motors, hot gas anti-sweat heaters, or high-efficiency compressors, which will significantly reduce energy consumption.

This measure was developed to be applicable to the following program type: TOS.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new ENERGY STAR[®] certified vertical closed or horizontal closed, solid or glass door refrigerator or freezer meeting energy consumptions requirements as determined by door type (solid or glass) and refrigerated volume (V).

Volume (ft ³)	Maximum Daily Energy Consumption (kWh/day)		
· · · ·	Refrigerator	Freezer	
Vertical Closed			
Solid Door			
0 < V < 15	$\leq 0.02V + 1.60$	$\leq 0.25V + 1.55$	
$15 \le V < 30$	\leq 0.09V + 0.55	\leq 0.20V + 2.30	
$30 \le V < 50$	\leq 0.01V + 2.95	\leq 0.25V + 0.80	
$V \ge 50$	$\leq 0.06V + 0.45$	\leq 0.14V + 6.30	
Glass Door			
0 < V < 15	$\leq 0.10\mathrm{V} + 1.07$	\leq 0.56V + 1.61	
$15 \le V < 30$	$\leq 0.15 \mathrm{V} + 0.32$	\leq 0.30V + 5.50	
$30 \le V \le 50$	$\leq 0.06V + 3.02$	$\leq 0.55 V - 2.00$	
$V \ge 50$	$\leq 0.08\mathrm{V} + 2.02$	\leq 0.32V + 9.49	
Horizontal Closed			
Solid or Glass Doors			
All Volumes	$\leq 0.06\mathrm{V} + 0.60$	$\leq\!0.10V+0.20$	

ENERGY STAR® Requirements (Version 3.0, Effective October 1, 2014)

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new vertical closed or horizontal closed, solid or glass door refrigerator or freezer that is not ENERGY STAR[®] certified.

2.9.2 Refrigerated Beverage Vending Machine

DESCRIPTION

This measure applies to new ENERGY STAR[®], Class A or Class B refrigerated vending machines. ENERGY STAR[®] vending machines incorporate more efficient compressors, fan motors, and lighting systems as well as a low power mode option that allows the machine to be placed in low-energy lighting and/or low-energy refrigeration states during times of inactivity.

This measure was developed to be applicable to the following program type: TOS.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new or rebuilt ENERGY STAR[®], Class A or Class B³²⁹ refrigerated vending machine meeting energy consumptions requirements as determined by equipment type (Class A or Class B).

ENERGY STAR [®]	[®] Requirements (Version 3.1, Effective March 1, 2013)

Equipment Type	Maximum Daily Energy Consumption (kWh/day)
Class A	\leq 0.0523V + 2.432
Class B	$\leq 0.0657 V + 2.844$

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new or rebuilt, Class A or Class B refrigerated vending machine that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.330

DEEMED MEASURE COST

The incremental cost of this measure is \$140.331

CALCULATION OF SAVINGS

331 Consistent with Ameren Missouri MEEIA 2016-18 and KCPL TRM assumptions.

MEEIA 2019-21 Plan

³²⁹ Class A means a refrigerated bottled or canned beverage vending machine that is fully cooled, and is not a combination vending machine. Class B means any refrigerated bottled or canned beverage vending machine not considered to be Class A, and is not a combination vending machine. See 10 CFR §431.292 "Definitions concerning refrigerated bottled or canned beverage vending machines."

³³⁰ Average of measure lives recognized by Ameren Missouri (10 years) and KCPL (14 years). Also consistent with Energy Star[®] commercial refrigerator lifetime.

2.9.3 Door Heater Controls for Cooler or Freezer

DESCRIPTION

This measure applies to door heater controls installed on commercial coolers or freezers. There are two main categories of commercially available control strategies that achieve "on-off" control of door heaters based on either (1) the relative humidity of the air in the store or (2) the "conductivity" of the door (which drops when condensation appears). In the first strategy, the system activates door heaters when the relative humidity in a store rises above a specific set point and turns them off when the relative humidity falls below that set point. In the second strategy, the sensor activates the door heaters when the door conductivity falls below a certain set point and turns them off when the conductivity rises above that set point. Savings result from a reduction in electric energy use due to heaters not running continuously and from reduced cooling loads when heaters are off. The assumptions included within this measure assume that door heater controls which are properly designed and commissioned will achieve approximately equivalent savings, regardless of control strategy.

This measure applies to the following program type: RF.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a door heater control installed on a commercial glass door cooler or freezer.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a door heater without controls, installed on a commercial glass door cooler or freezer.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.³³⁶

DEEMED MEASURE COST

Actual incremental costs should be used if available. The incremental capital cost \$151 per door. 337

2.9.4 Electronically Commutated Motors (ECM) for Walk-in and Reach-in Coolers/Freezers

DESCRIPTION

This measure consists of replacement of an existing, uncontrolled, and continuously operating standard efficiency shaded-pole evaporator fan motor in refrigerated display cases or fan coil in walk-ins.

This measure achieves savings by installing a more efficient motor, thereby moving the same amount of air with less energy requirements. Additionally, less waste heat is produced, resulting in a decreased refrigeration load.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

This measure applies to the replacement of an existing standard-efficiency shaded-pole evaporator fan motor in refrigerated display cases or fan coil in walk-ins. The replacement unit must be an electronically commutated motor (ECM). Savings assume that efficient motors operate continuously.

DEFINITION OF BASELINE EQUIPMENT

The baseline is the existing shaded-pole motor(s) with no fan control operating 8760 hours continuously in a refrigerated display case or fan coil unit of a walk-in cooling unit.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.³⁴²

DEEMED MEASURE COST

The measure cost is assumed to be \$177 per motor for a walk in cooler and walk in freezer, including the cost of the motor plus installation.³⁴³

LOADSHAPE

Miscellaneous BUS

Algorithm

CALCULATION OF SAVINGS

Savings are based on a measure created by Energy & Resource Solutions for the California Municipal Utilities Association and supported by PGE workpaper PGE3PREF126. Note that climate differences across all California climate zones resulted in negligible savings differences, which indicates that the average savings for the California study should apply equally as well to

2.9.5 Strip Curtain for Walk-in Coolers and Freezers

DESCRIPTION

This commercial measure pertains to the installation of infiltration barriers (strip curtains) on walkin coolers or freezers. Strip curtains impede heat transfer from adjacent warm and humid spaces into walk-ins when the main door is opened, thereby reducing the cooling load. As a result, compressor run time and energy consumption are reduced. The engineering assumption is that the walk-in door is open for varying durations per day based on facility type, and the strip curtain covers the entire door frame. All assumptions are based on values that were determined by direct measurement and monitoring of over 100 walk-in units in the 2006-2008 evaluation for the CA Public Utility Commission.³⁴⁵

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a strip curtain added to a walk-in cooler or freezer. The new strip curtain must cover the entire area of the doorway when the door is opened.

DEFINITION OF BASELINE EQUIPMENT

The baseline assumption is a walk-in cooler or freezer that previously had either no strip curtain installed or an old, ineffective strip curtain installed.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 4 years.³⁴⁶

DEEMED MEASURE COST

The incremental capital cost for this measure is \$10.22/sq ft of door opening.³⁴⁷

2.10 Shell

2.10.1 Windows

DESCRIPTION

Energy and demand saving are realized through the installation of windows that offer performance improvements over baseline windows. Savings may be realized from reducing air infiltration, improved insulating properties, and changes to solar heat gain through the glazed surfaces of the building.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of the IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing window assemblies.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC 2012. An efficient window would have specifications not exceeding these values.

	Climate Zones 4 & 5
U-Factor	
Fixed Windows	0.38 Btu/ft ² .°F.h
Operable Windows	0.45 Btu/ft ² .°F.h
SHGC	0.40

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.³⁵¹

DEEMED MEASURE COST

For retrofit projects, full installation costs should be used, including both material and labor costs to install the windows.

In all other scenarios, the incremental cost for this measure is assumed to be \$1.50 per square foot of window area. 352

Cooling BUS

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building.

 $\Delta kWh = \Delta kWh cooling + \Delta kWh heating$

Heating and cooling savings are composed of three components: infiltration, conduction and solar gains. In instances where infiltration savings do not apply or are not eligible, it may be disregarded. If central cooling, the electric energy saved in annual cooling due to the added insulation is:

 $\Delta k Wh_{cooling} = Infltration_{cooling} + Conduction_{cooling} + Solar_{cooling}$

$Infiltration_{Cooling} = (CFM_{PRE} - CFM_{POST})$) * 60 * F	EFLH _{cooling} *	$\Delta T_{AVG,cooling}$	* 0.018 *
LM / (1000 * η _{cooling})				

Where:

11010	•	
	CFMPRE	= Infiltration at natural conditions as estimated by blower door testing
		before window upgrade
		= Actual
	CFMpost	= Infiltration at natural conditions as estimated by blower door testing after
		window upgrade
		= Actual
	60	= Converts Cubic Feet per Minute to Cubic Feet per Hour
	EFLHcooling	= Equivalent Full Load Hours for Cooling [hr] are provided in Section 2.7,
	-	HVAC End Use
	$\Delta T_{AVG,cooling}$	= Average temperature difference $[{}^{0}F]$ during cooling season between
		outdoor air temperature and assumed 75°F indoor air temperature – see
		table below
	0.018	= Specific Heat Capacity of Air (Btu/ft ³ °F)
	LM	= Latent Multiplier to account for latent cooling demand 353
		= 3.0 for St. Louis, MO
	1,000	= Conversion from Btu to kBtu
		= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)
	ηcooling	= Actual

³⁵³ The Latent Multiplier is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

Revision 4.05.0

Appendix H - TRM - Vol. 2: C&I Measures

2.10.2 Ceiling and Wall Insulation

DESCRIPTION

Energy and demand saving are realized through reductions in the building cooling and heating loads.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing insulation. It should be based on the entire wall assembly.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC 2012:

	ASHRAE/IECC Climate Zone 5 (A, B, C) Nonresidential		
	Assembly Maximum Insulation Min. R-Value		
Mass	U-0.078	R-11.4 ci	
Metal Building	U-0.052	R-13 + R-13 ci	
Metal Framed	U-0.064	R-13 + R-7.5 ci	
Wood Framed and Other	U-0.064	R-13 + R-3.8 ci or R-20	

	ASHRAE/IECC Climate Zone 6 (A, B, C) Nonresidential		
	Assembly Maximum Insulation Min. R-Value		
Mass	U-0.078	R-13.1 ci	
Metal Building	U-0.052	R-13 + R-13 ci	
Metal Framed	U-0.064	R-13 + R-7.5 ci	
Wood Framed and Other	U-0.051	R-13 + R-7.5 ci or R-20 + R-3.8 ci	

Note: ci = *continuous insulation*

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure expected useful life (EUL) is assumed to be 20 years per DEER 2008. This is consistent with SDG&E's 9th Year Measure Retrofit Study (1996 & 1997 Residential Weatherization Programs), CPUC's Energy Efficiency Policy Manual v.2, and GDS's Measure Life Report Residential and Commercial/Industrial Lighting and HVAC Measures (June 2007).

DEEMED MEASURE COST

For retrofit projects, full installation costs should be used.

For new construction projects, costs should be limited to incremental material and labor costs associated with the portion of insulation that exceeds code requirements.

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building:

 $\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$

If central cooling, the electric energy saved in annual cooling due to the added insulation is

$$\Delta kWh_{cooling} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{cooling} * \Delta T_{AVG, cooling}}{(1,000 * \eta_{cooling})}$$

If the building is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

$$\Delta kWh_{heating} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{heating} * \Delta T_{AVG,heating}}{(3,412 * \eta_{heating})}$$

Where:

Rexisting	= Assembly heat loss coefficient with existing insulation [(hr- ⁰ F-ft ²)/Btu]		
Rnew	= Assembly heat loss coefficient with new insulation [(hr- ⁰ F-ft ²)/Btu]		
Area	= Area of the surface in square feet.		
CRF	= Correction Factor. Adjustment to account for the effects the framing has		
	on the overall assembly R-value, when cavity insulation is used.		
	= 100% if Spray Foam or External Rigid Foam		
	= 50% if studs and cavity insulation ³⁵⁷		
EFLHcooling	= Equivalent Full Load Hours for Cooling [hr] are provided in Section 2.7,		
	HVAC End Use		
$\Delta T_{AVG,cooling}$	= Average temperature difference [⁰ F] during cooling season between		
	outdoor air temperature and assumed 75°F indoor air temperature		
1,000	= Conversion from Btu to kBtu		
$\eta_{cooling}$	= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)		
	= Actual		

MEEIA 2019-21 Plan

Revision 4.0<u>5.0</u>

³⁵⁷ Consistent with the information listed in ASHRAE, 2001, Table 5-1 Wall Sections with Steel Studs Parallel Path Correction Factors and experimental findings by the Oak Ridge National Laboratory, "Couple Secrets about How Framing is Effecting the Thermal Performance of Wood and Steel-Framed Walls."

Appendix H - TRM – Vol. 2: C&I Measures

EFLHheating	= Equivalent Full Load Hours for Heating [hr] are provided in Section 2.7,
	HVAC end use
$\Delta T_{AVG,heating}$	= Average temperature difference [⁰ F] during heating season between
	outdoor air temperature and assumed 55°F heating base temperature
3,412	= Conversion from Btu to kWh.
η_{heating}	= Efficiency of heating system
	= Actual. Note: electric resistance heating and heat pumps will have an
	efficiency greater than or equal to 100%

Weather Basis	OAAVG,cooling	ΔTAVG,cooling	OAAVG,heating	ΔTAVG ,heating
(City based upon)	[°F] ³⁵⁸	[°F]	[°F] ³⁵⁹	[°F]
St Louis, MO	80.8	5.8	43.2	11.8

If the building is heated with a gas furnace, there will be some electric savings in heating the building attributed to extra insulation since the furnace fans will run less.

 $\Delta kWh_{heating} = \Delta Therms * Fe * 29.3$

Where:

∆Therms	= Gas savings calculated with equation below.
Fe	= Percentage of heating energy consumed by fans, assume $3.14\%^{360}$
29.3	= Conversion from therms to kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWH_{cooling} * CF$

Where:

 $\Delta kWH_{cooling}$ = Annual electricity savings for cooling, as calculated above.

= Summer peak coincidence demand (kW) to annual energy (kWh) factor for Cooling

= 0.0004439830

NATURAL GAS SAVINGS

³⁵⁸ National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/by_state_and_city.html. Heating Season defined as September 17th through April 13th, cooling season defined as May 20 through August 15th. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded. ³⁵⁹ National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/by_state_and_city.html. Heating Season defined as September 17th through April 13th, cooling season defined as May 20 through August 15th. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

³⁶⁰ Fe is not one of the AHRI certified ratings provided for furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14% for residential units. This is, appropriately, ~50% greater than the Energy Star[®] version 3 criteria for 2% Fe. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference. Assumed to be consistent with C&I applications.

Appendix H - TRM – Vol. 2: C&I Measures

If building uses a gas heating system, the savings resulting from the insulation is calculated with the following formula.

$$\Delta \text{Therms} \qquad \frac{=\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{heating} * \Delta T_{AVG,heating}}{(100,000 * \eta_{heat})}$$

Where:

= Assembly heat loss coefficient with existing insulation [(hr-⁰F-ft²)/Btu] R_{existing} R_{new} = Assembly heat loss coefficient with new insulation [(hr-⁰F-ft²)/Btu] = Area of the surface in square feet. Assume 1000 sq ft for planning. Area EFLHheating = Equivalent Full Load Hours for Heating are provided in Section 2.7, HVAC end use $\Delta T_{\rm AVG,heating}$ = Average difference $[{}^{0}F]$ during heating season (see above) = Conversion from BTUs to Therms 100,000 = Efficiency of heating system η_{heat} = Actual
