Exhibit No. 302
Date 6-25-01 Case No. GR-2001-292
Reporter Stewart

BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MISSOURI

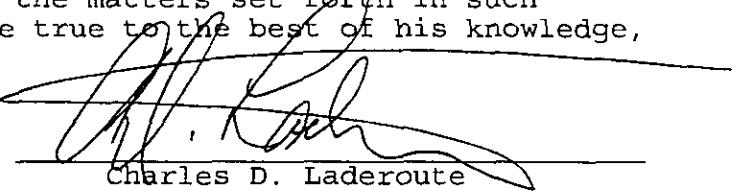

In the Matter of Missouri Gas)
Energy's tariff sheets designed to)
increase rates for gas service in)
the Company's Missouri service)
area.)

GR-2001-292

AFFIDAVIT OF CHARLES D. LADEROUTE

STATE OF MISSOURI)
) ss
COUNTY OF JACKSON)

Charles D. Laderoute, of lawful age, on his oath states: That he has reviewed the attached written testimony in question and answer form, all to be presented in the above case, that the answers in the attached written testimony were given by him; that he has knowledge of the matters set forth in such answers; that such matters are true to the best of his knowledge, information and belief.

Charles D. Laderoute

Subscribed and sworn to before me this 21st day of May, 2001.

Notary Public

[SEAL]

My Commission expires: 11/03/03

**REBUTTAL TESTIMONY OF
CHARLES D. LADEROUTE**

1 Q. Please state your name, occupation and address.

2 A. My name is Charles D. Laderoute. I am an energy consultant
3 and President of Charles D. Laderoute, Ltd., 5114 Amazonia
4 Road, St. Joseph, Missouri 64505.

5 Q. Are you the same Charles D. Laderoute who has previously
6 filed testimony in this case?

7 A. Yes.

8 Q. What is the purpose of your Rebuttal Testimony in this
9 proceeding?

10 A. I will address the Direct Testimony and cost of service
11 allocation studies ("COSS") prepared by Staff Witness Beck
12 and Office of the Public Counsel ("OPC") Witness Busch. I
13 also address certain issues raised by OPC Witness Hu, OPC
14 Witness Colton and MGE Witness Cummings. I am also sponsor-
15 ing Revised Schedules (Schedule CDL-Reb-1) which were dis-
16 tributed to all parties at the May 8, 2001 Prehearing Con-
17 ference. Finally, I am proposing an alternative method for
18 setting the rate class revenue levels in this case.

Q. Please identify the Schedules which you are sponsoring in this Rebuttal testimony.

A. I am sponsoring the following Schedules, all of which are part of this exhibit and all of which were prepared by me:

| <u>Schedule</u> | <u>Description</u> |
|-----------------|--|
| CDL-Reb-1 p. 1 | Schedule CDL-6 Revised Page 1 of 3 |
| CDL-Reb-1 p. 2 | Schedule CDL-6 Revised Page 2 of 3 |
| CDL-Reb-1 p. 3 | Schedule CDL-6 Revised Page 3 of 3 |
| CDL-Reb-1 p. 4 | Schedule CDL-7 Revised Page 1 of 26 |
| CDL-Reb-1 p. 5 | Schedule CDL-7 Revised Page 2 of 26 |
| CDL-Reb-1 p. 6 | Schedule CDL-7 Revised Page 3 of 26 |
| CDL-Reb-1 p. 7 | Schedule CDL-7 Revised Page 10 of 25 |
| CDL-Reb-1 p. 8 | Schedule CDL-7 Revised Page 19 of 25 |
| CDL-Reb-1 p. 9 | Schedule CDL-10 Revised Page 1 of 1 |
| CDL-Reb-1 p. 10 | Schedule CDL-14 Revised Page 1 of 3 |
| CDL-Reb-1 p. 11 | Schedule CDL-14 Revised Page 2 of 3 |
| CDL-Reb-1 p. 12 | Schedule CDL-14 Revised Page 3 of 3 |
| CDL-Reb-1 p. 13 | Schedule CDL-15 Revised Page 1 of 26 |
| CDL-Reb-1 p. 14 | Schedule CDL-15 Revised Page 2 of 26 |
| CDL-Reb-1 p. 15 | Schedule CDL-15 Revised Page 3 of 26 |
| CDL-Reb-1 p. 16 | Schedule CDL-15 Revised Page 10 of 25 |
| CDL-Reb-1 p. 17 | Schedule CDL-15 Revised Page 19 of 25 |
| CDL-Reb-1 p. 18 | Schedule CDL-16 Revised Page 1 of 26 |
| CDL-Reb-1 p. 19 | Schedule CDL-16 Revised Page 2 of 26 |
| CDL-Reb-1 p. 20 | Schedule CDL-16 Revised Page 3 of 26 |
| CDL-Reb-1 p. 21 | Schedule CDL-16 Revised Page 10 of 25 |
| CDL-Reb-1 p. 22 | Schedule CDL-16 Revised Page 19 of 25 |
| CDL-Reb-2 | Comparison of Cost of Service Studies Assuming Revenue Neutrality |
| CDL-Reb-3 p. 1 | Comparison of Parties COSS - Revenue Neutral COSS Percents-Exclude UMGL |
| CDL-Reb-3 p. 2 | Comparison of A/C 376 Mains Allocation |
| CDL-Reb-4 p. 1 | Determination of Difference Between MGUA & OPC COSS-Margin Revenue |
| CDL-Reb-4 p. 2 | Distribution PIS Allocation - MGUA |
| CDL-Reb-4 p. 3 | Distribution PIS Allocation - MGUA COSS Modified for OPC Mains Allocation |
| CDL-Reb-4 p. 4 | MGUA Revenue Neutral Summary Page |
| CDL-Reb-4 p. 5 | MGUA Revenue Neutral Summary Page reflecting MGUA COSS Modified for OPC Mains Allocation |

19 Revenue

20 Q. Please describe the Revised Schedules which were distributed
21 to all parties at the May 8, 2001 Prehearing Conference.

22 A. While preparing for the May 8, 2001 prehearing conference
23 (hereafter "prehearing conference"), reviewing my work, and
24 beginning to prepare material for Rebuttal, I discovered two
25 errors that traced back to my original COSS that was submit-
26 ted as Schedule CDL-7. Unfortunately, these were carried
27 forward to the later COSS studies and also affected other
28 schedules. I made the necessary changes to correct the
29 errors, duplicated the affected sheets of the schedules and
30 distributed them to all parties. The material has been
31 included as Schedule CDL-Reb-1. Within this schedule are
32 the various pages of the other schedules that were affected.

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 Q. Please summarize the most important portions of this Rebut-
2 tal Testimony.

3 A. The key areas that I address in this testimony are:

- 4 o The Staff COSS allocates more Mains Plant in Ser-
5 vice ("PIS") to the Residential class than my
6 study.
- 7 o The Staff COSS allocates approximately the same
8 amount of Mains PIS to rate class LVS as my study.
- 9 o Cost items other than Mains are the driving force
10 behind the difference between the amount of costs
11 allocated to the LVS class in my study versus that
12 of Staff.
- 13 o Contrasting the OPC COSS with my study, the allo-
14 cation of Mains accounts for only about 28% of the
15 difference for the two studies of costs allocated
16 to the LVS class.
- 17 o The RSUM method used by OPC to allocate demand
18 related Mains PIS does not properly reflect cost
19 causation.
- 20 o Based upon analysis of 16 items in my COSS using
21 Staff allocation methods, I am able to explain 96%
22 of the difference of costs allocated to the LVS
23 class.
- 24 o Based upon analysis of 17 items (including Mains)
25 in my COSS using OPC allocation methods, I am able
26 to explain 91% of the difference of costs allocat-
27 ed to the LVS class.
- 28 o My COSS is more accurate than either the OPC or
29 Staff studies because: it more closely reflects
30 cost causation, for the LVS and LGS classes it
31 reflects actual costs for Services, Meters and
32 Regulators and it specifically assigns other costs
33 correctly to the rate classes causing the costs.
- 34 o I also propose an alternative method to spread the
35 revenue increase in this case.

1 Q. Turning to your rebuttal of other party's COSS, there are
2 significant differences between the results of the three
3 COSS studies submitted in your Direct and Supplemental
4 Direct and that of Staff Witness Beck and OPC Witness Busch,
5 is that correct?.

6 A. Yes.

7 Q. Have you prepared a schedule to compare and contrast the
8 results?

9 A. Yes. Actually, I have prepared two schedules which serve to
10 illustrate the differences. The first is shown on Schedule
11 CDL-REB-2. This schedule is exactly like that sponsored by
12 Staff Witness Beck in Case No. GR-98-140 where he included
13 his Schedule 1 in Rebuttal Testimony. Schedule CDL-Reb-2
14 contrasts the "revenue neutral" COSS results for the three
15 parties preparing COSS in the instant case. One problem
16 with this approach is that my COSS was based on the numbers
17 originally filed by Missouri Gas Energy ("MGE") while the
18 Staff and OPC used the Staff numbers prepared by Staff for
19 the revenue requirements portion of this case. Lines 1 and
20 2 compared with Line 3 is not a valid comparison - an "ap-
21 ples and oranges "situation.

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 To account for the difference, I adjusted the Midwest Gas
2 Users' Association ("MGUA") numbers to synchronize with the
3 Staff numbers. On my schedule, I have identified all of the
4 data sources and beginning at Line 6 I show how I made this
5 synchronization. The approach at Lines 8 - 11 is analogous
6 to the method that Mr. Beck used in Case No. GR-98-140
7 against the MGE numbers in that case. The calculations
8 shown at Lines 13 - 19 are analogous to the method used by
9 Mr. Beck in this case on Schedule 1 of his Direct Testimony.

10 Q. Is there a better approach to compare the COSS results from
11 different parties?.

12 A. I believe that an approach based on each rate class's pro-
13 portion of total cost responsibility is a better approach.
14 This approach is known as **cost of service fractions**. It is
15 nothing new. Mr. Beck shows cost of service fractions on
16 Schedule 1 of his Direct Testimony at the bottom line enti-
17 tled "Class' Share of Total Margin Revenues" which should
18 have the word Required inserted after the word Total. Mr.
19 Busch on Schedule JAB-RD2 shows cost of service fractions at
20 Line 33, though the line is labeled as Margin Revenue it is
21 actually Total Operating Revenue which is the sum of Margin
22 Revenue and Other Operating Revenue.

1 At least one benefit of using cost of service fractions is
2 that it facilitates comparisons when two or more parties are
3 using different Revenue Requirements values. It is
4 unitless. Looking at Schedule CDL-Reb-2 Line 3, the values
5 by rate class are driven by the numbers MGE filed and are a
6 function of the revenue neutral margin revenue. For my
7 original numbers, the values shown at Line 3 are a function
8 of the existing margin revenue value of \$131,882,802 (Line 8
9 Column b). Using my values applied against the Staff's
10 Margin Revenue value of \$135,461,461 (Line 11 Column b),
11 gives the different units shown on Line 4. The cost of ser-
12 vice fractions method has the added benefit that it facili-
13 tates other determinations as I will illustrate.

14 On Schedule CDL-Reb-3, I illustrate this approach. At the
15 top of this schedule, I show the COSS required values for
16 the three COSS studies. Under the values at Lines 1, 8 and
17 13 (MGUA, Staff and OPC respectively) I have calculated the
18 COSS fractions. These simply take each rate class's revenue
19 requirements as a fraction of the total requirements. One
20 interprets these values as follows: the Residential required
21 revenue requirements are 74.4710377% of total revenue re-
22 quirements based on my COSS while they are 70.7673321% based
23 on the Staff study.

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 At Lines 16 - 19, I show the difference between my study and
2 that of Staff and OPC. At Lines 22 - 25, I show the values
3 as percents to two decimals rather than fractions. Much of
4 the balance of my analyses and comparison will use this
5 approach which will further illustrate how **cost of service**
6 **fractions** can be used.

7 Q. Mr. Laderoute, a significant portion of the difference
8 between the three COSS is due to allocation of Mains, is
9 that correct?

10 A. No.

11 Q. But isn't the allocation of Mains, Account 376, one of the
12 differences between the three studies?

13 A. Yes, that is correct. Mr. Busch, in the OPC COSS, used the
14 Relative System Utilization Method ("RSUM") method. I used
15 Peak Month's consumption. Mr. Beck, in his Direct Testimo-
16 ny, did not indicate how he allocated anything. He indicat-
17 ed that he updated the model used in MGE's Case No. GR-98-
18 140 with data that Staff updated based on the numbers that
19 Staff developed in the instant case. In Case No. GR-98-140,
20 Mr. Beck also did not provide much information as to how he
21 performed his COSS, but indicated that it was an update of
22 the study that he had prepared for Case No. GR-96-285. So,

1 unfortunately, in order to find out how Mr. Beck's COSS was
2 performed, one has to go back and review his testimony in
3 Case No. GR-96-285. There, we find that he allocated Mains
4 Plant in Service ("PIS") based on two components - a stand-
5 alone component and an integrated system component. The
6 impact of the stand-alone component is much like that of a
7 minimum system and the costs, determined by class, are
8 assigned by class. Mr. Beck indicated in his Rebuttal
9 Testimony in Case No. GR-98-140 at page 5 that:

10 Staff's "Underlying Cost" mains allocator
11 determined the percentage of the cost of
12 mains that could be considered to be stand-
13 alone costs (which are similar to customer
14 related costs) versus integrated system costs
15 (which are similar to capacity related costs)
16 to be 28% and 72% respectively.

17 Presumably this is still the case. According to his Direct
18 Testimony in Case No. GR-96-285 at pages 7-8:

19 Because the integrated system is sized to meet the
20 coincident peak demand of all customers, it is allocat-
21 ed to all rate classes in direct proportion to each
22 class' coincident peak demand.

23 Presumably this is also still the case. At the pre-hearing
24 conference, Mr. Beck confirmed that he used this approach in
25 the instant case.

26 Q. So, although the three different COSS in this case use a
27 different demand allocation method for Mains PIS A/C 376,

1 you state that a significant portion of the difference
2 between the three is not due to the allocation of Mains?

3 A. Between my study and that of Staff, yes, that is correct.
4 The different demand allocation method for Mains accounts
5 for only about 22% of the difference between my study and
6 that of the OPC for the residential class. The major dif-
7 ferences between the three is not due to the allocation of
8 Mains PIS, but is due to the allocation of other cost items.
9 In fact, comparing the allocation of Mains in the Staff COSS
10 with that in my COSS, the Staff allocates more Mains to the
11 Residential rate class. Our allocations to the LVS class
12 are almost identical. No doubt, some will find that sur-
13 prising. See Schedule CDL-Reb-3 Page 2 where I have summa-
14 rized the amount of Mains allocated to each class in the
15 three COSS. Note that for Mains, all three studies are
16 using the same dollar value. Moreover, the actual impact of
17 the Staff value versus mine is even more on a relative basis
18 considering the levels of total Rate Base in the three COSS.
19 The amounts are, \$518,824,134, \$486,933,326 and \$486,933,-
20 326, for MGUA, Staff and OPC, respectively. (Taken from
21 Schedule CDL-15 Page 1, Beck Direct Schedule 1 and Busch
22 Schedule JAB-RD2, respectively.)

1 Focusing on the Staff values versus my values, considering
2 just Residential and LVS, clearly my study's Mains alloca-
3 tion is **not** what is causing the Residential class to bear a
4 higher relative portion of costs in my study compared to the
5 Staff study. For the LVS class, the difference of Mains
6 allocation is trivial.

7 Q. Looking at your COSS results versus that of the OPC study,
8 given that the results of the RSUM allocation is so much
9 dramatically different than your allocation, is that the
10 primary driving force between your study's results and that
11 of the OPC?

12 A. Again, the answer is no. Certainly the level of Mains PIS
13 that are allocated to the Residential class is more in my
14 study versus the amount reflected in the OPC study. Howev-
15 er, only about 22% of the COSS difference between the two
16 studies is a function of the difference in the allocation of
17 Mains related costs. Please see Schedule CDL-Reb-4 Page 1.
18 At Line 1, I indicate the level of revenue neutral margin
19 revenue from my Mod I COSS as revised. Within my COSS, I
20 allocate Mains Accumulated Depreciation and Mains Distribu-
21 tion Expense on the basis of Mains PIS (see Supplemental
22 Testimony Schedule CDL-15 Page 9 Line 4 and Schedule CDL-15
23 Page 17 Line 9, respectively). Therefore, if the Mains PIS

1 is allocated on a **different** basis and everything else in the
2 COSS is held the same (aside from internal calculations that
3 flow through the allocation), the impact on revenue neutral
4 margin revenue will reflect the change caused only by using
5 the different Mains allocation factor.

6 Thus, I modified my Mod I Revised COSS by allocating Mains
7 PIS on the basis of the OPC Mains allocator. Schedule CDL-
8 Reb-4 Page 2 shows the results of the allocation of Distri-
9 bution PIS as I described in my original prefiled Direct
10 Testimony. This page comes from my Supplemental Testimony
11 and reflects the modifications discussed there. At Page 3
12 of Schedule CDL-Reb-4, I have modified the page in two ways
13 so as to use the OPC Mains allocator. First, while both the
14 OPC COSS and my COSS reflects assigning the Mains less than
15 3 inches to Residential and SGS, the manner in which we did
16 it differs. I did it directly (see previous page 2 of
17 Schedule CDL-Reb-4) and allocated to the two classes. As
18 described in the Testimony of OPC Witness Hu at Pages 6, 13
19 and Schedule DIR HH-1, OPC assigned these costs indirectly
20 by modifying their RSUM allocator. Therefore, I zeroed out
21 the value in the Total column at Line 5 on Schedule CDL-REB-
22 4 Page 3. Second, I input the OPC RSUM allocator directly

1 at Line 31. The COSS then reallocated the values at Line 7
2 based on the OPC Mains allocator.

3 The only other page of importance to see the impact is the
4 summary page. Schedule CDL-Reb-4 Page 4 shows the Revenue
5 Neutral bottom up page for the Mod I Revised COSS before the
6 change. Page 5 of Schedule CDL-Reb-5 shows this summary
7 page after the change for the Mains allocator had flowed
8 through the COSS. The highlighted lines show all the chang-
9 es, though only Line 27 is of importance. These values were
10 then carried back to Line 4 of Schedule CDL-Reb-4 page 1.
11 Focusing on Residential and LVS, this shows at Line 6 the
12 difference in my COSS for revenue neutral margin revenue by
13 simply changing the Mains allocator to the OPC RSUM method.
14 The changes are roughly the same - a decrease to Residential
15 of \$1,639,893 and an increase to LVS of \$1,776,714. (Refer-
16 ring back to Schedule CDL-Reb-2 Line 3, clearly the
17 \$1,639,893 is **not** the driving force in the cost differenc-
18 es.)

19 At Lines 9 - 17, I have simply copied the information from
20 above and determined cost of service fractions. At Line 21,
21 I show the impact in terms of the differences of the frac-
22 tions. This difference is caused by the change to the OPC

1 Mains allocator. At Line 25, I have brought the information
2 from Schedule CDL-Reb-3 Page 1 Line 19 which is the differ-
3 ence between the cost of service fractions from my COSS and
4 the OPC COSS. Line 26 is the difference due to the Mains
5 allocator change determined at Line 21. Line 27, therefore,
6 shows the cost of service fractions that are different due
7 to other cost allocations; that is, cost differences between
8 the two COSSs are not due to the different allocator being
9 used for Mains. At Lines 30 and 31, I show the percent
10 amounts due to the Mains allocation and other factors. For
11 Residential, this shows that approximately 22% of the dif-
12 ference between revenue requirements in my study and the OPC
13 are due to the different Mains allocation factor used while
14 about 78% is due to other allocations within the respective
15 studies.

16 Q. What conclusions do you draw?

17 A. With respect to my COSS versus Staff's, my Mains allocator
18 allocates less costs to Residential than Staff does - there-
19 fore, the Mains allocator is not the cause of my COSS show-
20 ing a larger revenue deficiency than Staff for Residential.
21 Regarding LVS, the two studies are not too far different, so
22 the differences in revenue sufficiency for LVS is not due to
23 my Mains allocator used. With respect to my study versus

1 the OPC study, for Residential, less than 25% of the differ-
2 ence is due to the Mains allocator while approximately 28%
3 of the difference between the studies for LVS is due to the
4 Mains allocator. Thus, with respect to either of the other
5 studies, the major cost differences are caused by alloca-
6 tions other than Mains.

7 Q. Do you have some thoughts as to what might be causing the
8 major differences in the COSS results?

9 A. Yes. There are many differences between our studies other
10 than the method used to allocate Mains. Within my study,
11 for many items, I specifically assigned costs. I did not
12 cherry pick and just load assignments to classes other than
13 LVS. On the contrary, I assigned costs to just the LVS
14 class for costs that they incur - e.g. Electronic Gas Mea-
15 suring equipment in Account 385. Other costs were assigned
16 only to rate classes other than LVS. This is part of the
17 differences. Additional differences are clearly a function
18 of allocations per se -- that is, the method and the result-
19 ing allocator. For example, both OPC and Staff allocated
20 costs associated with AMR equipment to the LVS class. There
21 is no logical reason for doing so. There is no regulatory
22 precept that would lead one to do this. The numbers are
23 easily and clearly identifiable and the amount of time to

1 allow for an analyst to model this in a COSS is trivial -
2 particularly given the level of dollars involved. This is
3 unfair and unjust. The LVS customers have paid up to \$5,000
4 per customer specifically for their own automated meter
5 reading devices referred to as Electronic Gas Measurement
6 ("EGM") equipment. And just as LVS customers should **not** pay
7 any of the costs of AMR equipment, so too the classes other
8 than LVS should **not** pay for any of the costs of EGM equip-
9 ment. In sum, the LVS class could never use the AMR meters
10 even if they wanted to. So they are not a **cost causer** of
11 these costs. Some might rejoin that AMR reduced Meter
12 Reading costs. That may well be, but is immaterial. The
13 LVS meters have been automatically read since first in-
14 stalled beginning in 1993. Further, the LVS is being allo-
15 cated in my study Meter Reading costs as well. That item is
16 weighted using a weight of 45 for LVS in my COSS. Messrs.
17 Beck and Busch both used a weight of 8.76 for LVS.

18 In total, I have identified 8 specific areas which includes
19 16 items where I have significant concern as to how costs
20 were allocated within the OPC and Staff studies - aside
21 from the method that they used to allocate Mains. These
22 areas of concern are:

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 AMR related costs - General plant, Intangible plant,
2 Depreciation, et cetera

3 Storage Gas Inventory in Working Capital

4 Working Cash for Purchased Gas in Working Capital

5 Utilization of specific investment information for
6 assignment of Meters, Services and Regulators

7 Allocation of Other Operating Revenues

8 Gas Supply related costs included in A&G Expenses

9 Gas component of Uncollectibles Expense

10 Sales Expenses

11 Q. Have you analyzed these differences and if so, what conclu-
12 sion can be drawn?

13 A. Yes. Please see Schedule CDL-Reb-5. At the bottom of this
14 schedule, I show that by analyzing 16 different cost items,
15 I can account for approximately 96% of the difference be-
16 tween my COSS and that of Staff and 91% for OPC. At page 2
17 of Schedule CDL-Reb-5, I show the determination of the
18 effect upon my COSS of using the allocation methods (alloca-
19 tors) used by Staff. That is, using the COSS that I pre-
20 pared, what change to the amount allocated to the LVS class
21 is brought about when changing from my allocation method to
22 that used by Staff. The same values for OPC has been deter-
23 mined on Schedule CDL-Reb-5 Page 3. I have provided source

1 explanation on the schedules which explains where the num-
2 bers came from or how they are developed.

3 I will walk through this for AMR to explain what I did.
4 First, note that there are four separate entries for cost
5 items pertaining to AMR shown at the following Lines: 1, 2,
6 19 and 20. As indicated above, the LVS class should bear
7 none of the costs of AMR equipment. It is simply a fluke
8 that they are accounted for as General plant rather than in
9 a Distribution Plant account (e.g. Meters). They are after
10 all, a metering device. Regardless, the costs are easily
11 identifiable in the original MGE Schedules and workpapers
12 and should be allocated to Rate classes Residential, SGS and
13 LGS only. My allocations are shown on Schedule CDL-15 of
14 the Supplemental Testimony at Page 8 for both AMR General
15 Plant A/C 397.1 and Intangible-AMR related, and Page 17 for
16 AMR Beta Amortization and Depreciation of General Plant
17 Account 397.1. At Page 8, you can see that I assigned the
18 costs to Sales customers (Rates: Residential, SGS and LGS)
19 and then allocated to those classes on the basis of number
20 of customers. (My study in Schedule CDL-16 described in my
21 Supplemental Testimony accounts for the one Sales customer
22 in the LVS rate class.) Note that while I also separately
23 allocated Accumulated Depreciation for AMR equipment in my

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 COSS at Page 9, it was not necessary for my analysis here,
2 which I will explain below.

3 Focusing on Line 1 of Schedule CDL-Reb-5 Page 2, AMR Equip-
4 ment A/C 397.1 was allocated by Staff using Total P, T & D
5 PIS. Since MGE has no Production or Transmission PIS, this
6 means that this item was allocated by Staff on the basis of
7 each class' portion of Total Distribution PIS. The factor
8 they used is shown at Column d. The amount in Column b to
9 be allocated was taken from my COSS. That value may be
10 found in Supplemental Testimony Schedule CDL-15 Page 8, Line
11 2, Total column. At Column e on Page 2 of Schedule CDL-Reb-
12 5, I indicate the amount that would be allocated using the
13 Staff allocator. At Column f, I indicate the amount of zero
14 as the value from my COSS, since the class should bear none
15 of these costs. (See Schedule CDL-15 Page 8 Line 2.) At
16 Column g, I indicate the fraction that my allocator is of
17 the Total for the LVS class. I show at Column h the extra
18 amount that is allocated using the Staff allocator compared
19 to the amount that I have allocated for each item. Negative
20 values mean that my COSS allocates **more** costs for an item
21 than the Staff COSS. For the Rate Base related items shown
22 on Lines 1 - 8, I have calculated Fixed Charge Factors in
23 the Footnote 3 at the bottom of the schedule. Two factors

1 are shown since the Working Capital items have Return and
2 FIT, but no associated Depreciation. The Fixed Charge
3 Factors are then carried to Column i and multiplied by the
4 values in Column h to determine the Revenue Requirements
5 related values shown at Column j. I then applied this
6 methodology to all of the Rate Base cost items. For items
7 other than Rate Base, the values determined in Column h are
8 carried to Column j. This same approach was used on Page 3
9 of Schedule CDL-Reb-5 to determine the difference between my
10 COSS results and that shown in the OPC COSS.

11 The final values on Pages 2 and 3 were carried forward to
12 Page 1 of this schedule where I simply added the amounts for
13 Staff and OPC to my values. Note that while we were using
14 different Total Revenue Requirements inputs, my values shown
15 at Lines 5 and 12 on Page 1 of Schedule CDL-Reb-5 are in the
16 vicinity of those determined by Staff and OPC in their
17 Direct Testimony, respectively, Schedule 1 C-O-S Margin
18 Revenue @ 0% and Schedule JAB-RD2 Line 32 (excluding the
19 \$323,207 of Other Revenue at Line 9). In the middle portion
20 of Page 1 of Schedule CDL-Reb-5, I have determined COSS
21 fractions. I then compare my COSS values for COSS Fractions
22 adjusted for Staff and OPC allocators against the Staff and
23 OPC fractions shown. As a result, my COSS for revenue

1 neutral costs adjusted for Staff and OPC allocators for the
2 LVS are nearly identical to the fractions for the Staff and
3 OPC . While many different values can be grouped, the cost
4 items that I selected for this analysis were key to me
5 since, for each, I believe that the Staff and OPC methods
6 are inappropriate.

7 Q. Mr. Laderoute, in general are the differences between the
8 COSS caused by the choice of some method or allocator to
9 allocate a common cost item?

10 A. Aside from the differences between the OPC and MGUA study
11 with respect to the Mains allocator - No. Definitionally,
12 within a COSS, common cost items are those for which there
13 is no one unique allocator; e.g. Mains PIS. As I discussed
14 in my Supplemental Direct Testimony at Pages 8 and 9, when a
15 cost analyst can assign costs, they should. In practice,
16 cost assignment is done in several ways. One of the most
17 important factors used is the process of elimination. That
18 is, can one assign costs specifically to one or more rate
19 class? If so, those costs should be specifically assigned
20 to that class or classes. The foundation upon which this is
21 based is **cost causation**. While it is a revenue item rather
22 than a cost item, current Residential revenue is accounted
23 for in a COSS since it offsets the required revenue require-

1 ment - for example, existing revenue is \$100,000, but
2 \$150,000 is needed. Would it make any rational or logical
3 sense to assign or allocate some portion of Residential
4 revenue to the LGS or LVS rate classes? Of course not! And
5 that holds for costs as well. Does it make any sense to
6 allocate costs for EGM equipment, which is in place to serve
7 only LVS customers, to any other class? No.

8 A second important factor in cost assignment is determining
9 the appropriate costs to assign. In some cases, a special
10 study may be performed to determine the costs by rate class.
11 Sometimes a direct approach is not available, so some indi-
12 rect approach must be used. In my experience, I have found
13 several problematical or key areas here with respect to
14 assignment of cost and special studies: ignorance, lack of
15 effort and lack of data. Ignorance is not meant in a derog-
16 atory sense, but in the sense that an analyst just is not
17 aware of how to do something. Lack of effort means that the
18 analyst does not take the time necessary to make a determi-
19 nation whose end result is more accurate than some other
20 approach. In some cases this just may be that they are
21 lazy. In other cases, for whatever reason, they just do not
22 take the time necessary to perform a study to determine an
23 appropriate methodology. Or they do something simply be-

1 cause that is the way it has always been done - regardless
2 of whether it is right or wrong. Finally, there are times
3 when data is simply not available. For larger companies
4 such as MGE, I have seldom seen this to be a legitimate
5 issue. Usually it boils down to asking the question the
6 right way or finding the right person in order to get requi-
7 site data.

8 Q. Could you please elaborate and give an example of what you
9 are describing?

10 A. Certainly. Let's focus on Services - Distribution PIS A/C
11 380. In a perfect world we would have the cost of Services
12 or Meters for every customer. In the real world that is not
13 possible. However, it is often the case that some data for
14 certain classes may be available. In my experience, I
15 usually find that detailed information for larger customers
16 is often available - if one asks the right question to the
17 right person. When I performed my initial COSS, there were
18 many outstanding Data Requests to MGE including a request
19 for actual Meters and Services cost by rate class. In order
20 to get my COSS done, I had to determine costs in the form of
21 weights for Services, Meters, Regulators and Meter Installa-
22 tions. Messrs. Busch and Beck also used a weighted customer
23 approach, though our methods differed. I initially used the

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 weighted costs supplied by MGE to Witness Hu in Case No. GR-
2 98-140. I had reservations in using that data. See my
3 Direct Testimony at Pages 40 - 43. This is the same data
4 that OPC Witness Busch used in his COSS - compare his Direct
5 Testimony Schedule JAB-RD1 data with the data I show on
6 Schedule CDL-11 attached to my Supplemental Testimony. For
7 example, we both used \$14,524.80 as Services cost for LVS.

8 As it turned out, my reservations were on the mark. As I
9 discussed in my Supplemental Testimony, MGE supplied **actual**
10 cost information for Meters, Services and Regulators for the
11 **actual** LGS and LVS customers (Response to DR Nos. 181 and
12 221.) See Schedule CDL-12 in my Supplemental Testimony.
13 The actual average cost per Meter, Service and Regulator for
14 LGS and LVS data is more **accurate** since it in **fact** repre-
15 sents the actual average embedded historical cost. There-
16 fore, applying the number of customers in my COSS for LGS
17 and LVS multiplied by the average cost per item gives me the
18 assignable costs. See Schedule CDL-12. After assigning the
19 costs for LGS and LVS any residual costs for Meters, Servic-
20 es and Regulators are a result of Residential and SGS cus-
21 tomers.

1 At Schedule CDL-7 Page 25 of my Direct and Schedule CDL-15
2 Page 25 of My Supplemental Direct, I show the per customer
3 unit costs for Services, Meters, Meter Installations and
4 House Regulators. Comparing the numbers you can see the
5 dramatic impact that using the actual data has. For LVS
6 Services, the cost per customer was reduced from \$11,396.77
7 to \$2,784.74. The latter is based on actual embedded his-
8 torical costs. And those costs are what are used for set-
9 ting revenue requirements in this State and for this utili-
10 ty.

11 Note that in doing this, I assigned costs to two classes
12 because MGE was able to provide me with actual data for
13 those two classes. Whatever costs remain after assigning
14 the costs to those two classes are costs attributable to
15 Residential and SGS customers.

16 Q. Please describe why you think the Staff and OPC allocation
17 methods are inappropriate for each of the 16 items identi-
18 fied on Pages 2 and 3 of Schedule CDL-Reb-5.

19 A. I have already clearly stated why Staff and OPC COSS are
20 incorrect with respect to the four items related to AMR
21 equipment. Note from Schedule CDL-Reb-5 Pages 2 and 3,
22 Staff and OPC, respectively, allocate \$340,876 and \$428,095

1 of AMR costs to the LVS class. These values should be zero.
2 I will discuss the more important differences for the other
3 items.

4 **Working Capital Gas Inventory**, shown at Line 3, should not
5 be allocated to Transportation customers. These costs are
6 associated with gas held in inventory to serve Sales custom-
7 ers. Transportation customers provide their own gas and,
8 moreover, have no right to use Storage Gas. If they did,
9 they would get hit with a penalty charge from MGE. Both OPC
10 and Staff allocated costs associated with Working Capital
11 Gas Inventory to the LVS class, respectively, \$321,870 and
12 \$731,633. There is no logical reason for doing so. There
13 is no regulatory precept that would lead one to do this.
14 This is unfair and unjust. The LVS customers pay for their
15 own gas and cannot use gas in storage without incurring
16 penalties. They are not a cost causer of these costs. The
17 cost causers are the Sales customers on Rates Residential,
18 SGS and LGS. And while there may be one Sales customer in
19 the LVS class, I have already identified the cost to serve
20 him in my Supplemental Testimony Schedule CDL-16 as Revised
21 in Schedule CDL-Reb-1 at Pages 18-22. MGE wanted to close
22 the LVS rate class in their last case. I have accounted for
23 the cost to serve that customer in my Schedule CDL-16. As

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 can be seen at Schedule CDL-Reb-1 Page 12, this one customer
2 causes \$109,603. The customer came to LVS from LGS during
3 2000. Given that the additional cost to serve this customer
4 is \$0.79 per Mcf, they should be placed back on LGS and LVS
5 should be closed to Sales customers. Moreover, for whatever
6 reason Staff had in the last case to argue (and prevail) for
7 retaining Sales customers on LVS, this is no reason that
8 costs attributable to Sales classes Residential, SGS and LGS
9 should be borne by the other 440 LVS customers. In the bal-
10 ance of this testimony, I will not address this customer,
11 because I believe that this customer properly should not be
12 on this rate and because I would otherwise have to insert a
13 provisio on each comment. The existence of this customer
14 should not deflect attention from the issues of proper costs
15 for the other 440 LVS customers who are transporters.

16 Like Working Capital Gas Inventory, **Working Capital Working**
17 **Cash - O&M Purchased Gas**, shown at Line 4, should not be
18 allocated to Transportation customers. These costs are
19 associated with gas purchased to serve Sales customers.
20 Transportation customers provide their own gas and, more-
21 over, have no right to use any gas purchased by MGE. If
22 they did use MGE gas, they would get hit with a penalty
23 charge from MGE. Both OPC and Staff allocated costs associ-

1 ated with this item to the LVS class. There is no logical
2 reason for doing so. There is no regulatory precept that
3 would lead one to do this. This is unfair and unjust. The
4 LVS customers pay for their own gas and cannot use gas
5 purchased by MGE for its Sales customers without incurring
6 penalties. They are not a cost causer of these costs. The
7 cost causers are the Sales customers on Rates Residential,
8 SGS and LGS. And yet, the Staff and OPC respectively,
9 allocate \$145,681 and \$72,641 of these costs to the LVS
10 class.

11 The difference in the allocation of **Services**, Line 5, is
12 significant with respect to the value used by OPC. In our
13 case, as I describe in my Supplemental Testimony and above,
14 MGE provided us with the **actual** cost incurred for LGS and
15 LVS customers with respect to Meters, Services and Regula-
16 tors. That is, we have not had to rely on weights - we used
17 the **actual embedded** costs that MGE has incurred, costs
18 caused by LGS and LVS customers, to determine their costs
19 for these three items.

20 In addition to my earlier comments, here is the impact of
21 the difference between my assignment/allocation for Services
22 and that of the OPC. At Schedule CDL-Reb-5 Page 3 Line 5

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 Column h, I show that the OPC allocation method, when ap-
2 plied to my data, allocates \$3,897,398 **more** costs than my
3 COSS to LVS. In total, Column e, their approach allo-
4 cates/assigns \$5,209,009. Based on LVS customer count of
5 471 (441 plus additional 30 Meters & Services), their ap-
6 proach results in a per customer unit cost of \$11,059.47 for
7 Services. Clearly this is inaccurate when the actual aver-
8 age cost of Services for LVS customers is actually
9 \$2,784.74. Their method imputes \$8,274.73 of additional
10 cost of Services per customer that just simply does not
11 exist. Column j of this schedule shows that the OPC method
12 inappropriately allocates \$480,608 of revenue requirements
13 to the LVS class for just this item alone.

14 My biggest concern with **Meters PIS A/C 381**, is the Meter per
15 Customer ratio used by OPC Witness Busch. At Page 6, Line
16 23 of his Direct Testimony, he indicates that a large per-
17 cent of LGS and LVS customers have multiple meters. Yet on
18 Schedule JAB-RD1 he shows a meter per customer ratio of 1.00
19 for LVS and .86 for LGS. The latter implies that there is
20 only 86/100ths of a meter for an LGS customer or conversely
21 1.16 customers per meter for LGS. This is illogical as
22 these are large customers who one would expect would have at
23 least one meter per customer. His own calculations show 412

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 meters for 482 LGS customers. And the ratio of 1.00 does
2 not support his statement that LVS customers have multiple
3 meters. Throughout my study, I acknowledged that there were
4 441 LVS customers with 471 Meters and Services.

5 At Page 7, Lines 14 - 22 of his testimony, OPC Witness Busch
6 describes his approach to spreading "unaccounted for" meters
7 to non-residential classes. Aside from providing no ratio-
8 nale for this, it is just plain wrong. MGE holds meters in
9 inventory for a variety of reasons, two of the most impor-
10 tant being replacements and growth. Since the most dramatic
11 growth (and the largest number of customers) is in the
12 Residential class, a large number of Meters is held there
13 for growth and replacement in the Residential class. So his
14 meter/customer ratio is just plain wrong.

15 Regarding **Electronic Gas Measurement Equipment A/C 385**, this
16 is only used by, and as is required for, LVS customers.
17 These costs should be assigned only to the LVS rate class.
18 The Staff allocated these costs to LGS and LVS. OPC allo-
19 cated these costs to all rate classes other than Residential
20 which is incorrect. In fact, for their allocator applied
21 against my costs, they would only allocate \$2,218 to LVS

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 since they allocate these on the basis of C & I customers
2 which loads the costs almost entirely on SGS customers.

3 As I noted earlier, I wanted to assign costs appropriately
4 and as part of my Data Requests, I asked MGE numerous ques-
5 tions in an attempt to get costs that could be assigned -
6 including the assignment of costs to the LVS class. With
7 respect to **Accounts 920-1**, MGE identified \$35,208 attribut-
8 able to customers on rate LVS. I assigned these to the LVS
9 customers and neither Staff nor OPC made a similar assign-
10 ment.

11 I asked MGE to provide costs associated with **Gas Supply and**
12 **Gas Accounting in Account 923** as part of Data Request Number
13 150. I specifically assigned these costs to the classes
14 Residential - LGS since these costs are associated with
15 providing commodity gas for sales. These costs are **not**
16 caused by LVS customers. These costs are associated with
17 personnel related to activities to serve Sales customers.
18 Transportation customers provide their own gas and, more-
19 over, have no right to use MGE's gas. Neither the OPC nor
20 Staff acknowledged this in their allocated costs. There is
21 no logical reason that the LVS customers should pay any
22 costs associated with the supply of commodity gas. There is

1 no regulatory precept that would lead one to do this. This
2 is unfair and unjust. The LVS customers pay for their own
3 gas and cannot use gas procured by MGE. They are not a cost
4 causer of these costs. The cost causers are the Sales
5 customers on Rates Residential, SGS and LGS.

6 **Uncollectibles A/C 904** should be broken down into two compo-
7 nents - a portion due to gas commodity cost and a portion
8 due to margin revenue. I did so in my study, while OPC and
9 Staff did not. While I subscribe to the notion that this is
10 an overhead cost that must be borne by all customers, I also
11 subscribe to the notion that only Sales customers should
12 bear the cost responsibility for the Uncollectibles costs
13 associated with commodity gas. LVS customers provide their
14 own gas. They do not buy gas from MGE. Therefore, the
15 portion of Uncollectibles attributable to the gas commodity
16 portion should only be allocated to those who buy MGE's gas
17 - rate classes Residential, SGS and LGS. Due to their
18 allocation of Uncollectibles in toto, Staff and OPC allocate
19 respectively, \$212,589 and \$279,900 to LVS class that should
20 be borne by the other classes.

21 **Other Operating Revenues** are a cost offset. That is, they
22 serve to offset the costs within a COSS. These are however,

1 treated as a line item in a COSS - they are not treated as a
2 cost of service class or column. Because of that, there are
3 costs allocated to rate classes within a COSS which underlie
4 the cost of providing the service that generates these Other
5 Revenues. These costs are buried in the COSS at various
6 locations and are allocated across rate classes. It some-
7 times helps to think of Other Operating Revenues as similar
8 to Uncollectibles except that rather than being an overhead
9 cost, these Other Operating Revenues are an overhead bene-
10 fit. Since the costs are allocated elsewhere to the various
11 classes, the benefit should also be shared across the rate
12 classes. In order to provide some matching between the
13 costs and the benefits, all rate classes should share. In
14 my COSS, I allocated these Other Operating Revenues across
15 all classes on the basis of a 50-50 weighting between vol-
16 umes and customers. In my mind this is a fair apportion-
17 ment. Staff on the other hand assigned these revenues to
18 Residential and SGS and allocated them to those classes on
19 the basis of Residential and SGS bills. I understand the
20 logic. The logic for that is that most of these Other
21 Operating Revenues are generated by the Residential and SGS
22 classes. BUT, most Uncollectibles are generated by the same
23 two classes. In order to be logically consistent between
24 Uncollectibles and Other Operating Revenues, the benefit of

1 the latter must also accrue to other rate classes. In fact,
2 there is even more of a case to be made with respect to
3 Other Operating Revenue since the customer accounting costs
4 and other operating costs for the personnel who deal with
5 disconnects, reconnects and so on have been allocated else-
6 where in the to all classes. The Staff approach allocates
7 \$660,825 less of cost offsetting Other Operating Revenue to
8 LVS than my study. It all boils down to cost (in this case
9 benefit) causation. The impact of the OPC allocation is not
10 quite as dramatic as they use the more broad based "cost of
11 service" allocator.

12 Q. Mr. Laderoute, let's return to the RSUM allocator that the
13 OPC used to allocate Demand related Mains PIS. Did you
14 invent the Relative System Utilization Method (RSUM)?

15 A. Yes, in the early 1980s.

16 Q. And yet you do not believe that it is a reasonable method
17 for the allocation of Demand related Mains PIS? Please
18 explain.

19 A. Like Staff, which used estimated Peak Coincident day demand
20 for the allocation of demand related Mains PIS, I believe
21 that the most appropriate allocator for demand related Mains
22 is a measure of Peak loads. The Mains system is sized to

1 meet the coincident demands of all customers. In my case, I
2 used the coincident monthly Mcf consumption for the month of
3 the system peak. Thus, to allocate demand related Mains, I
4 used each rate class' Mcf contribution to peak month's total
5 consumption.

6 I categorically believe that when directly applied, RSUM
7 does not result in a fair apportionment of demand related
8 Mains cost. It imputes loads that simply do not exist in
9 terms of cost causation. It results in costs being borne by
10 others than who caused the cost in the first place. The
11 system is in fact designed and sized based on coincident
12 loads - not some fabricated loads. In the case of the data
13 that I used, the LVS class causes 20.27% of the peak month
14 load. See Schedule CDL-8 in my Direct Testimony. Based on
15 its workpapers, the Staff used a Coincident Day demand
16 allocator of 19.25% for the LVS rate class. The OPC unad-
17 justed RSUM allocator for the LVS class is 24.77%. From a
18 pure cost causation point of view, the OPC allocator imputes
19 or attributes an additional 4.5% (24.77-20.27) of load that
20 a system planner would not take into consideration.

1 As Professor Bonbright states in his Principles of Public
2 Utility Rates (1969) at page 354 when comparing various
3 demand allocation methods:

4 Of the three formulas just described, the one that
5 would probably come closest to receiving support from
6 the economists, at least viewed from the standpoint of
7 cost analysis, is the system-peak responsibility meth-
8 od.

9 Indirectly, there are uses of RSUM where it might be appro-
10 priate. In the case where demand related costs have been
11 allocated to rate classes on the basis of some notion of
12 peak responsibility, the class demand related costs could be
13 allocated to costing periods on the basis of RSUM. Thus,
14 these costs, be they LDC Mains costs or pipeline Reservation
15 Charges could be allocated to say, an On Peak and Off Peak
16 period on the basis of relative RSUM weights after the costs
17 have been allocated to classes on the basis of a peak re-
18 sponsibility method.

19 Q. Turning to some specific issues addressed in Staff Witness
20 Beck's Testimony, do you agree with his conclusion at Page 3
21 Lines 16-17 that most of the rate classes are at or near
22 their class revenue responsibility?

23 A. No. My COSS is much more accurate than both the Staff and
24 OPC in terms on reflecting cost causation. At Page 13 of
25 Schedule CDL-Reb-1 (Schedule CDL-15 Revised Page 1), my Top

1 Down analysis based on the numbers filed by MGE, shows that
2 with a total Rate of Return ("ROR") of 5.88%, Residential is
3 earning 4.85% while LVS is earning 11.43%. LVS is earning
4 an Index of 194 or 1.94 times the system actual ROR while
5 Residential is earning .82 times the overall ROR. The next
6 page shows that for a Revenue Neutral position, the LVS
7 class would have to be **reduced** by \$3,220,603 and Residential
8 **increased** by \$6,369,575 for all rate classes to earn the
9 same (held constant) overall Return of 5.88%. Even at the
10 total revenue increase requested by MGE, Page 15 of Schedule
11 CDL-Reb-1 shows that the LVS revenues should be decreased.

12 Q. Staff Witness Beck indicates in his Testimony at Page 4
13 Lines 7 - 13, that most current Customer Charges are at or
14 above the indicated customer related costs from the COSS.
15 Do you agree?

16 A. No. My COSS is much more accurate than either the Staff or
17 OPC studies - particularly with respect to Customer Related
18 Costs. The unit Customer related costs are driven in large
19 part by the amount of investment in Services, Meters and
20 Regulators. Moreover, the costs associated with AMR equip-
21 ment should be included in the Customer Charge since they
22 are a Customer Related cost no different that the costs
23 associated with a Meter. Schedule CDL-17 of my Supplemental

1 Testimony contrasts the results of my COSS modifications to
2 costs based on assigning actual costs for Meters, Services
3 and Regulators for the LVS and LGS rate classes. Compared
4 with my original results shown at Line 1, the adjusted
5 values based on the Modifications 3-8 described in my Sup-
6 plemental Testimony show higher Customer related costs for
7 Residential and SGS and lower values for LGS and LVS. In
8 fact, my results show that Residential through LGS Customer
9 Charges can be supported at higher levels, while the level
10 for LVS could be reduced. Please note that these values
11 were unaffected by the revisions that I included in Schedule
12 CDL-Reb-1.

13 Q. OPC Witness Busch indicates in his Direct Testimony at Page
14 5, Lines 15 - 16 that he tried to allocate costs to the
15 "actual cost causers" with respect to Meters, Regulators and
16 Services. Please comment.

17 A. As I indicated earlier in this testimony, in fact my study
18 does attribute these costs much more accurately than either
19 the OPC study (in particular) or the Staff study based on
20 who is causing the costs. It is one thing to state that
21 costs should be allocated to who causes costs, yet quite
22 another to actually perform a COSS that actually reflects
23 proper cost causation.

1 Q. In his Direct Testimony at Page 1, Lines 21 - 22 and Page 2
2 Lines 22 - 23, OPC Witness Busch states that the COSS should
3 provide an estimate of the cost of providing service and
4 that he used allocators to distribute a reasonable share of
5 costs to each customer class. Do you agree that his study
6 does that?.

7 A. No. As I indicated at length above, his study in fact allo-
8 cates unfairly much too many costs to the LVS class. Based
9 on my study using his allocation methods and allocators, he
10 allocates over \$3 million inappropriately to the LVS class
11 excluding the allocation of Mains.

12 Q. Turning to the Testimony of OPC Witness Hu, at Page 15 Lines
13 1 - 9, she indicates a number of factors that should be
14 considered in setting a just and reasonable rate level.
15 Please comment.

16 A. I will address each of the factors that she has identified.
17 With respect to these, she gives us no indication of the
18 relative weight that cost should bear in a Commission deci-
19 sion. I will. A cost of service study should serve as the
20 primary input in determining rate class revenue levels.
21 Otherwise, why waste all the time performing such studies?
22 In my opinion and in general, the cost of service study
23 should weigh no less than 80 to 90% in the final balancing

1 of factors. The other factors might be weighted at 10 to
2 20% of the final decision.

3 With respect to **value of service**, this is a term that is
4 often misused. In actual practice for a gas LDC, it is of
5 most importance when there are competitive alternatives.
6 For example, if oil is a valid alternative for some custom-
7 ers and the cost of service is too high relative to the
8 costs for those customers to use oil, based on value of
9 service, if it desired to keep those customers on system,
10 some discount from cost based rates is necessary. The same
11 holds true in cases where a customer or customers may bypass
12 the system and attach directly to a pipeline. Most often,
13 the term value of service is misused in the sense of charg-
14 ing some class whatever the traffic will bear.

15 **Affordability** is a term that is so twisted and turned it
16 becomes meaningless. Affordable to who and in what circum-
17 stances? This past winter the price of gas went up for
18 everyone - transporters and residential customers alike.
19 Should that be a factor in this case? No, it isn't an
20 issue. If there were a recession, should rate levels be set
21 lower for C & I customers because they have a hard time
22 affording to pay their gas bills? No. Usually,

1 affordability becomes a political issue directed at residen-
2 tial customers. The notion is typically that residential
3 customers cannot afford the service, but somehow C & I cus-
4 tomers can. This issue, in my mind, has no place in regula-
5 tion. If society sees fit to subsidize one group over
6 another - i.e. income transfers - that is a political issue
7 that should be left to the legislators.

8 **Rate impact** is another term that is confusing or often
9 misused or abused. Assume that a rate class (Class A)
10 revenue levels should go up by 25% in order to reflect
11 costs. That may or may not be viewed as a large impact. Re-
12 gardless, if that class is not brought up by 25%, then by
13 definition, some other class or classes must intentionally
14 subsidize that class in order for the company to remain
15 whole. Moreover, this is an issue that can have a self
16 fulfilling prophecy and create a systemic problem. Assume
17 that rate levels are not set at allocated costs - the reason
18 being rate impact. The next time the utility files for a
19 rate case the hole gets deeper as revenues are not recover-
20 ing costs and the disparity between costs and revenues gets
21 larger. So, perhaps rather than requiring a 25% increase to
22 get rate levels to costs, the class chosen to be the recipi-

1 ent of intentional subsidization, Class A, now would require
2 a 32% increase.

3 This can be a particular problem when one considers who is
4 in fact causing the costs to be incurred. As I indicated in
5 my Direct Testimony and on Schedule CDL-3, AMR costs are a
6 significant factor in this case; well over \$5,000,000 in
7 revenue requirements. Those costs were not caused by the
8 LVS class. In reviewing the rate impact of this case, the
9 Commission should surely consider that those costs are not
10 attributable to LVS - regardless of the impact on Rates
11 Residential, SGS and LGS.

12 Since its last rate case, MGE has added substantially to
13 Mains with most of the customer growth being in the classes
14 Residential and SGS. While impact of the growth related
15 Mains may have a substantial rate impact, the Commission
16 should in fact consider that most of the associated costs
17 for the growth related Mains was added not to serve LGS and
18 LVS, but the other two classes. So while the rate impact
19 may be significant, the cost causers should bear the costs.

20 **Rate Continuity** is a term that is more appropriate in view
21 of the actual rate structure - not the rate level. In this

1 case, a rate continuity issue would be the proposal by MGE
2 to move the Residential rate class from a Customer charge to
3 a Minimum Bill. The former includes no consumption, while
4 MGE has proposed a Minimum bill that includes the first 20
5 Ccf.

6 Q. OPC Witness Hu in Direct Testimony at Page 15, Lines 19 - 21
7 proposes that "no customer class should receive a net de-
8 crease as the combined result of the revenue neutral shift
9 that is applied to that class and the share of the total
10 revenue increase that is applied to that class". Do you
11 agree?

12 A. There are a couple of problems with this logic. First, it
13 is a function of accepting a two step process premised on
14 accepting someone's definition of a revenue neutral shift in
15 concert with a revenue increase. Second, it depends on how
16 one approaches the revenue neutral shift. In this case, OPC
17 recommends 50% movement or revenue shift based on the reve-
18 nue neutral shift shown in their study. There is nothing
19 magic about this 50%. Further, it is based on their study.
20 As I have indicated above, their revenue neutral COSS is
21 inaccurate. Finally, and most importantly the overall
22 approach is illogical. Essentially, it suggests that no
23 class can get a net rate decrease while another class is

1 getting a rate increase. (Witness Hu has stated just that
2 at Page 19, Lines 6 - 7.) This approach certainly benefits
3 if there are lots of classes. What would happen if there
4 were only two rate classes? One could never set rate levels
5 at cost - even if they wanted to. So if an approach is
6 illogical when there are only two rate classes, it suddenly
7 becomes logical when there are four rate classes? Of course
8 not.

9 Q. Are there portions of MGE Witness Dr. Cumming's Direct
10 Testimony that you wish to address?

11 A. Yes, three areas: cost causation relative to Other Operating
12 Revenue items, the Company proposal to spread the revenue
13 increase on the basis of existing class revenues, and Dr.
14 Cumming's list of factors other than cost that should be
15 considered in setting rate levels.

16 Q. At Page 7 Lines 6 - 18 of MGE Witness Dr. Cumming's Direct
17 Testimony, he discusses "cost causation" with respect to
18 setting the levels of charges that are booked to Other
19 Operating Revenues. Please comment.

20 A. I simply find it interesting that the Company thinks that
21 setting the levels for miscellaneous service charges should
22 be set based on cost causation, yet cost causation in their

1 opinion should mean essentially nothing in setting margin
2 revenues. As proposed by MGE in this case, the former
3 amount to \$4,858,301 while the latter amounts to \$131,-
4 882,267, including an increase of \$39,882,003.

5 Please note that I am not suggesting that their proposed
6 levels of charges for these miscellaneous service charges
7 are inappropriate. On the contrary, I am all for setting
8 utility services to levels based on costs.

9
10 Q. Like OPC Witness Hu, MGE Witness Dr. Cumming's in his Direct
11 Testimony at Page 9, Lines 13 - 16 lists factors other than
12 costs that in his opinion should be taken into consideration
13 in setting rate class revenue levels. Please comment.

14 A. Dr. Cummings list five factors other than costs that should
15 be considered in setting rate levels. Of his list, there is
16 probably only one that I share to any degree - fairness. In
17 my mind, the level of revenues for a rate class should be
18 fair. But in my mind, they can only be fair if they are
19 based on a reasonable cost of service study. Otherwise, how
20 does one decide what is in fact fair? One cannot when not
21 measured against the cost benchmark.

1 With respect to **customer acceptance**, obviously all customers
2 hate to see their rates go up. But how does one measure the
3 level of customer acceptance? No doubt, in this case the
4 Residential customers (numbering something on the order of
5 431,000) would be happy to see the rate increase spread to
6 the C & I customers in SGS, LGS and LVS. But is sheer
7 numbers of customers in a class an important factor in
8 setting rate levels? In my mind, this is one of the least
9 important "other" factors to consider in setting rate lev-
10 els.

11 **Stability** perhaps is a noble goal. Unfortunately, it is a
12 function of how frequently a utility files rate cases. To
13 the extent that the rate levels do not in fact recover the
14 correct amount of costs by rate class, the utility will be
15 in with a general rate increase more often.

16 **Gradualism** is an important factor when tied in with the goal
17 of moving rate levels to the levels indicated in a cost of
18 service study. In order to do this, though, there must be a
19 goal of setting rates on costs.

20 **Social considerations** have no place in regulation. They are
21 purely a political issue. Customers do not have a chance to

1 vote for Commission members. Moreover, one of the goals of
2 regulation is to bring about a result that one might expect
3 from a competitive market. Most consumers look to their
4 legislators, not the business marketplace for solutions to
5 society's problems.

6 Q. What issue do you take with MGE's proposal to spread the
7 increase on the basis of existing class revenues?

8 A. There is no evidence in this case that such a proposal would
9 bring the rate levels of this company any closer to a cost
10 basis. In fact, the Company did not even file a cost study.
11 If all of these other factors indicated by Dr. Cummings (and
12 OPC Witness Hu for that matter) are so important and exist-
13 ing class revenue levels are viewed as fair, then the entire
14 second portion of a rate case should be disbanded as a waste
15 of time, resources and effort. Since all of these other
16 factors and existing class revenues have nothing to do with
17 costs, how can one set up a benchmark against which to
18 measure rate levels? In short, one cannot.

19 With respect to the Residential and LVS classes, the
20 former's percentage of current revenues is 69.6% while their
21 costs are 74% of total. The same values for LVS are 8.2%
22 and 5.7% respectively. Thus, the ratio of current revenue

1 fractions to costs are 94.2% and 136.6% for Residential and
2 LVS, respectively. See Schedule CDL-Reb-6 Page 2.

3 Q. Do you take issue with any of the Testimony of OPC Witness
4 Colton?

5 A. Yes, several points. While there may be significant merit
6 in MGE changing its business practices, of course introduc-
7 ing his low income rate is in fact social ratemaking.
8 Colton testimony at Page 38 Line 31. His proposal would
9 take money out of the pocket of other Residential (this
10 class only at this point) ratepayers and use it to subsidize
11 a subgroup of Residential customers. This is a political
12 decision best left in the hands of the legislators.

13 While he has provided quite a rationale to create a specific
14 class of customers, one could do the same for many sub-
15 groups. For example, in the community that I live (MGE
16 service territory), the area that I live in is older while
17 the other side of town has new expensive houses where newer
18 Main has been laid to reach these customers. There is no
19 reason that MGE could not have a separate rate for the part
20 of town that I live in and a higher rate for the other side
21 of town. Mr. Colton himself points out similar thoughts at
22 pages 48 and 49 of his testimony.

1 Though this is a different cost issue and presented in a
2 different manner, there is little difference between the
3 issue here and the issues in GE-2001-393. The only differ-
4 ence is a different pool of dollars, different subsidizers
5 and different recipients.

6 Finally, while the subsidizing group may be proposed to be
7 other Residential customers in this case (an issue of fair-
8 ness in and of itself) there is little reason to believe
9 that another Commission at a later date might not decide
10 that all rate classes should be providing the subsidy.

11 Q. Mr. Laderoute, MGE, OPC and you in your Direct Testimony
12 have proposed methods to spread the increased revenues to
13 rate classes while the Staff did not make a specific propos-
14 al. Please comment.

15 A. I have addressed the other proposals earlier. With respect
16 to the proposal that I laid out in My Direct Testimony, I
17 wish to replace that with an alternative. Schedule CDL-Reb-
18 6 lays out a proposed method that I think would be reason-
19 able, given the historical background for this Company.
20 Essentially, what I propose is phasing in over a 3 year
21 period cost based rates based on my cost study. The results
22 for each of the three years is shown at Page 1 of this

1 schedule for various levels of rate increase. At the lower
2 portion of Page 2, I show the values to use for each year.
3 In the first year, revenue requirements would be spread on
4 the basis of a weighted factor - 75% current revenue and 25%
5 full COSS. The values used in the derivation are shown at
6 the top of this page. In the second year there would be a
7 Company revenue neutral reallocation between the classes.
8 In this year the factor would be weighted at 40% current
9 revenue and 60% full costs. In the third year there would
10 be another reallocation based on the full COSS fractions.
11 Pages 3 - 5 shows the determinations for each year. Note
12 that these show how the values would be allocated by year -
13 not the year by year changes. Page 6 shows the year by year
14 changes. Page 7 shows how the revenues would be spread
15 based on using just my COSS results at this time. Page 8
16 shows the MGE proposal in contrast.

17 Note on Pages 1 and 6, the Residential class receives the
18 largest impact in the first year. Using the Point of Refer-
19 ence of a \$10,000,000 increase, the first year share is so
20 significant because they represent 69.6% of current reve-
21 nues. (Schedule CDL-Reb-6 Page 2 Line 2) Under the MGE
22 proposal shown at Page 8 of this schedule, the Residential
23 class would receive \$6,964,131. The additional amount of

Rebuttal Testimony
Charles D. Laderoute
GR-2001-292

1 \$1,532,203 reflected in my proposal (8,496,334 - 6,964,131)
2 is due to the weighting in an attempt to match revenues with
3 costs. The net result of this proposal is that over a three
4 year period, the rates would be set on costs as they exist
5 at this point.

6 Q. Is it your opinion that this proposal is better than the
7 alternatives that have been suggested in this case?

8 A. Yes. And it reflects what I view as a reasonable compromise
9 in heading toward cost based rates.

10 Q. Does this conclude your Rebuttal testimony?

11 A. Yes, at this time it does. But there are outstanding re-
12 sponses to several data requests that we made to other
13 parties including Staff and Public Counsel on May 2. I
14 would respectfully reserve the ability to supplement this
15 testimony and certain schedules as might be indicated when
16 these responses are received.
