OF THE STATE OF MISSOURI**

In the Matter of Union Electric Company d/b/a)
AmerenUE for Authority to File Tariffs Increasing)
Rates for Electric Service Provided to Customers)
in the Company's Missouri Service Area.)

Case No. ER-2007-0002
Tariff No. YE-2007-0007

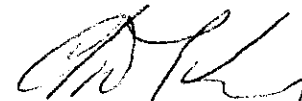

AFFIDAVIT OF CHARLES W. KING

CITY OF WASHINGTON)
)
DISTRICT OF COLUMBIA)

ss

Charles W. King, of lawful age and being first duly sworn, deposes and states:

1. My name is Charles W. King. I am a Public Utility Consultant for the Office of the Public Counsel.
2. Attached hereto and made a part hereof for all purposes is my sur-rebuttal testimony.
3. I hereby swear and affirm that my statements contained in the attached testimony are true and correct to the best of my knowledge and belief.

Charles W. King
Public Utility Consultant

Subscribed and sworn to me this 27th day of February 2007.

Angel Finch
Notary Public

My commission expires March 14, 2011.

Witness: Charles W. King
Type of Exhibit: Surebuttal Testimony
Sponsoring Party: Public Counsel
Case No.: ER-2007-0002
Date Testimony Prepared: February 27, 2007

**SUREBUTTAL TESTIMONY OF
CHARLES W. KING**

INTRODUCTION

Q. PLEASE STATE YOUR NAME, POSITION AND BUSINESS ADDRESS.

A. My name is Charles W. King. I am President of the economic consulting firm of Snavely King Majoros O'Connor & Lee, Inc. ("Snavely King"). My business address is 1111 14th Street, N.W., Suite 300, Washington, D.C. 20005.

Q. ARE YOU THE SAME CHARLES W. KING WHO SUBMITTED DIRECT TESTIMONY IN THIS CASE ON DECEMBER 15, 2006 AND REBUTTAL TESTIMONY ON JANUARY 31, 2007?

A. Yes. I am.

Q. DOES YOUR DIRECT TESTIMONY CONTAIN A STATEMENT OF YOUR QUALIFICATIONS AND EXPERIENCE?

A. Yes. Attachment A to that testimony is a brief summary of my educational and professional career. Attachment B is a listing of my appearances before regulatory agencies.

Q. WHAT IS THE OBJECTIVE OF YOUR SUREBUTTAL TESTIMONY?

A. The objective of this surebuttal testimony is to respond to the rebuttal testimony of the rate-of-return witnesses for AmerenUE. For matters relating to capital structure, these witnesses are Lee R. Nickloy and James H. VanderWeide. For

1 matters concerning the cost of equity, they are James H. VanderWeide and
2 Kathleen C. McShane.

3
4 **DOUBLE-LEVERAGE ADJUSTMENT**
5

6 **Q. BOTH MR. NICKLOY AND DR. VANDERWEIDE OBJECT TO YOUR**
7 **DOUBLE-LEVERAGE ADJUSTMENT. WHAT IS THE NATURE OF**
8 **THEIR OBJECTIONS?**
9

10 A. At page 2 of his pre-filed rebuttal testimony, Mr. Nickloy states that because
11 Ameren Corp. has not issued debt and contributed equity to AmerenUE, no
12 double-leverage adjustment should be made. At page 101 of his rebuttal
13 testimony, Dr. VanderWeide makes two points. The first is that AmerenUE's
14 equity conforms to the definition of equity, and the second is that not all
15 commissions have accepted double-leverage adjustments.
16

17 **Q. HOW DO YOU RESPOND TO MR. NICKLOY'S ASSERTION THAT NO**
18 **DOUBLE-LEVERAGE ADJUSTMENT IS NECESSARY BECAUSE**
19 **AMEREN HAS NOT USED DEBT TO FUND AMERENUE?**
20

21 A. It is not necessary to track funds across Ameren Corporation's balance sheet to
22 justify the double-leverage adjustment, as Mr. Nickloy implies. The reason for
23 the double-leverage adjustment is to avoid over-compensating Ameren's
24 shareholders. That is the inevitable result of not making this adjustment.
25

26 I demonstrate this fact in Schedule CWK-SR-1. In this schedule, I have assumed
27 that the Commission adopts all of my rate-of-return proposals except the double-
28 leverage adjustment. The effect of this assumption is set forth in lines 1 through 7
29 of schedule CWK-SR-1. I have applied AmerenUE's capital structure (column

Witness: Charles W. King
Type of Exhibit: Surebuttal Testimony
Sponsoring Party: Public Counsel
Case No.: ER-2007-0002
Date Testimony Prepared: February 27, 2007

1 A) to its proposed rate base (line 1) to show the distribution of that rate base
2 among the four components of capital. Column C presents AmerenUE's cost of
3 debt and my recommended cost of equity. Column D shows the dollar return on
4 each component. Cell 7D reveals that AmerenUE's equity return, after gross-up
5 for income taxes, is \$478,184,000.

6
7 Lines 8 through 13 show what happens when that \$478,184,000 is passed up to
8 Ameren Corp. The \$3,053 million (cell 5B) of AmerenUE's "equity" is not, in
9 fact, all equity at the parent level, only 94.3 percent of it is. The remaining 5.7
10 percent is short and long-term debt. This means that at the parent company level
11 only \$2,879 million of AmerenUE's \$3,053 million "equity" is actually equity.
12 In column C, lines 8 and 9, I apply AmerenUE's debt cost rates to the parent
13 company debt and column D on those same lines I show the dollar cost of that
14 debt. When that dollar cost is subtracted from the equity return allowed to
15 AmerenUE (cell 6D), the residual return to the parent company's shareholders is
16 \$468,677,000 (line 10).

17
18 When this \$468,677,000 is divided by AmerenUE's equity at the parent company
19 level, the pre-tax return is 16.28 percent (line 11). When that return is divided by
20 the tax gross-up factor (line 6), the after-tax return to Ameren's ultimate
21 shareholders is 10.03 percent. That return is 38 basis points higher than the
22 Commission intended to give AmerenUE's shareholders when it made the 9.65
23 percent equity return award.

24
25 The double-leverage adjustment is thus necessary to ensure that the actual equity
26 investors in AmerenUE receive only the authorized rate of return on their
27 investment.

1 **Q. HOW DO YOU RESPOND TO DR. VANDERWEIDE'S OBJECTIONS TO**
2 **YOUR DOUBLE-LEVERAGE ADJUSTMENTS?**

3
4 A. They are both irrelevant. I never suggested that AmerenUE's equity does not
5 conform to the conventional definition of equity. As I have just pointed out, the
6 reason for the adjustments has to do with ensuring that AmerenUE's ultimate
7 equity owners, who are the shareholder in Ameren Corp., are not
8 overcompensated for their investment in AmerenUE.

9
10 Of course there have been cases where double-leverage adjustments have been
11 rejected, just as there are cases where those adjustments have been accepted. I
12 have not taken a poll to identify the double-leverage acceptance score, for two
13 reasons. First, the circumstances undoubtedly differ from case to case, and
14 second, even if they were exactly analogous, regulation is not governed by the
15 majority vote of various regulatory commissions. It is governed by the evidence
16 submitted in each case.

17
18 **COMPARISON COMPANIES**

19
20 **Q. AT PAGE 4 OF HIS TESTIMONY, AND THEN AGAIN AT PAGE 89 TO**
21 **93, DR. VANDERWEIDE OBJECTS THAT YOUR COMPARISON**
22 **GROUP IS TOO SMALL. HOW DO YOU RESPOND?**

23
24 A. To begin with, Dr. VanderWeide should have directed his objections on this score
25 to his co-witness, Kathleen McShane. She uses only 17 electric companies, seven
26 less than my 24 companies and 17 less than Dr. VanderWeide's 34 companies.
27 But more to the point, I have presented good reasons for my classifications. I
28 reject four companies because they are predominantly gas companies, not electric

Witness: Charles W. King
Type of Exhibit: Surebuttal Testimony
Sponsoring Party: Public Counsel
Case No.: ER-2007-0002
Date Testimony Prepared: February 27, 2007

1 companies, and therefore have a different risk profile than AmerenUE's electric
2 service.

3
4 I reject another seven companies because they do not have 60 percent of their
5 revenues from regulated service. Finally, I reject TXU because its capital
6 structure is excessively leveraged. These are the most important exclusions
7 because of the very issue raised by both Company rate-of-return witnesses
8 concerning capital structure. Both Dr. VanderWeide and Ms. McShane argue that
9 it is inappropriate to apply unadjusted market-based equity returns to book-value
10 capital structures because the book capital structures are much more leveraged
11 than market capital structures.

12
13 As I point out in my rebuttal testimony, this argument has some validity when the
14 rate of return is derived from comparison groups that include largely or totally
15 unregulated companies. The disconnect between market and book capital
16 structures for those companies can lead to understated returns if their market rates
17 of return are applied to a book equity proportion of a regulated company. That is
18 why those companies must be eliminated from the comparison group.

19
20 **CAPITAL STRUCTURE ADJUSTMENT**

21
22 **Q. AT PAGE 8 OF HER REBUTTAL TESTIMONY, MS. MCSHANE**
23 **ASSERTS THAT YOU ARE INCORRECT IN EQUATING THE**
24 **COMPARABLE EARNINGS STANDARD OF *HOPE NATURAL GAS***
25 **WITH THE CAPITAL ATTRACTION STANDARD WHEN A MARKET-**
26 **BASED RATE OF RETURN IS APPLIED TO A BOOK VALUE CAPITAL**
27 **STRUCTURE. IS SHE CORRECT?**
28

1 A. No. As I have just observed, Ms. McShane's point might be valid if the market-
2 based rate of return is derived using a comparison group of largely unregulated
3 companies. But my comparison group consists entirely of electric utilities whose
4 earnings are authorized in the same manner as AmerenUE's. Each of those
5 companies receives its earning allowance through a market-based rate of return
6 applied to a book-based capital structure. When these companies, and only these
7 companies, are used in the comparison, there is no mistreatment of AmerenUE's
8 shareholders. The equity investors in each of these companies know that their
9 earnings, like AmerenUE's earnings, are tied to a book value rate base and a book
10 value capital structure.

11
12 **Q. AT PAGE 12 OF HER TESTIMONY, MS. MCSHANE CONTENDS THAT**
13 **YOU, THE STAFF AND OTHER INTERVENOR WITNESSES**
14 **"TARGET" A MARKET-TO-BOOK RATIO OF 1.0. IS SHE CORRECT?**

15
16 A. No. Objective evidence contradicts Ms. McShane's contention. Notwithstanding
17 that all of the companies in my comparison group have their regulated earnings
18 determined through a procedure that applies market-based returns to book-based
19 capital structures, all of them have market-to-book ratios greater than 1.0.

20
21 The reason for this pervasive pattern of market values in excess of book values
22 becomes obvious when one examines the theory behind the DCF methodology.
23 That theory holds that an investor's return requirement consists of two
24 components, the current dividend yield and the expectation of future growth in
25 dividends. When this DCF-based return is applied to a book value rate base in the
26 current year, investors are arguably over-compensated because they do not require
27 the growth component immediately. Rather, they look for that part of their return
28 out in the future. So, when their immediate return includes that growth element,
29 they find that their earnings exceed what they require on the book value of their

1 stock. As a result, they are willing to pay substantially more than book value to
2 acquire the stock.
3

4 **Q. AT PAGE 13 OF HER REBUTTAL TESTIMONY, MS. MCSHANE**
5 **CHALLENGES YOUR CONTENTION THAT THERE WOULD BE**
6 **CIRCULARITY IN A REGULATORY REGEME THAT ADJUSTS THE**
7 **RATE OF RETURN FOR THE ALLEGED DIFFERENCE BETWEEN**
8 **MARKET AND BOOK CAPITAL STRUCTURES. IS SHE CORRECT?**
9

10 A. No. On page 14 of her rebuttal testimony, Ms. McShane presents a table that
11 describes a steady state condition in which the regulatory commission has
12 presumably adopted her recommended "financial risk" adjustment. She finds that
13 this steady state would result in no change to the calculated DCF return.
14

15 Ms. McShane does not model the condition in which a commission converts from
16 the current practice of relying on book values and unadjusted rates of return to
17 one where the rate of return is adjusted in the manner she and Dr. VanderWeide
18 propose. If that happened, the utility would suddenly becomes more profitable,
19 which would drive up the value it its stock. That increase in the market value of
20 the stock would in turn be reflected in the market-based capital structure, causing
21 it to have a larger equity component. In the next rate case, the larger market-
22 based equity component would lead to a larger McShane/VanderWeide
23 adjustment to the DCF return, leading to a further increase in the allowed return,
24 hence a further increase in the market value of the stock. It could take quite a few
25 rate cases before this iterative process played itself out into the steady state
26 condition that Ms. McShane presents on page 14.
27

28 **DISCOUNTED CASH FLOW ANALYSIS**
29

1 **Q. WHAT OBJECTIONS DO THE AMERENUE WITNESSES RAISE**
2 **AGAINST YOUR DISCOUNTED CASH FLOW ANALYSIS?**

3
4 A. Both witnesses object that I use an "annual" model that does not recognize
5 quarterly compounding. Both argue that I employ what they deem to be an
6 incorrect procedure for forecasting the next year's dividend. Both object that my
7 application of the FERC 2-step methodology does not use the same inputs as
8 FERC. Dr. VanderWeide objects to my inclusion of Value Line's earnings
9 forecasts in estimating the "g" factor in the DCF formula. He also argues that the
10 Surface Transportation Board ("STB") uses only I/B/E/S forecasts in its DCF
11 analyses and that it applies those DCF results to the market values, not the book
12 values of the railroads' capital structures. Dr. VanderWeide asserts that the
13 FCC's Wireline Competition bureau did not use the DCF formula but rather the
14 CAPM procedure to estimate an equity return of 13.068 percent.

15
16 **Q. HAVE YOU PREVIOUSLY ADDRESSED THE ISSUE OF QUARTERLY**
17 **COMPOUNDING?**

18
19 A. Yes. In my rebuttal testimony, I pointed out that the compounding of quarterly
20 earnings happens when the investor receives the dividends and then reinvests
21 them. This occurs outside of the dividend issuing company and is therefore not
22 its responsibility.

23
24 **Q. HAVE YOU USED THE INCORRECT PROCEDURE TO ESTIMATE**
25 **THE NEXT YEAR'S DIVIDEND?**

26
27 A. No. I submit that the Company's witnesses use the incorrect procedure. Neither
28 witness provides a justification for the use of $1+g$ as the basis for the forecast of
29 next year's dividend. Each simply asserts that it is "correct." My use of Value

Witness: Charles W. King
Type of Exhibit: Surebuttal Testimony
Sponsoring Party: Public Counsel
Case No.: ER-2007-0002
Date Testimony Prepared: February 27, 2007

1 Line's forecast allows for company-specific analysis of dividend policy. In my
2 rebuttal, I noted the example of Empire District Electric, a company that has been
3 issuing dividends greater than its quarterly earnings. That company will not
4 increase its dividend in 2007, a fact that Value Line recognizes but the witnesses'
5 1+g approach does not.

6
7 **Q. HAVE YOU INCORRECTLY APPLIED THE FERC 2-STEP DCF**
8 **PROCEDURE?**

9
10 A. No. The fact that I have not used exactly the same sources of inputs as FERC
11 does not detract from the propriety of my formulation. For reasons I will discuss
12 shortly, I believe it is better to include Value Line's growth forecasts with those
13 of I/B/E/S in the DCF formulation. I did not use the same sources of GDP
14 forecasts as FERC, but neither did Ms. McShane. She used March 2006 Blue
15 Chip *Economic Indicators*, a source that is not publicly available. I used the
16 Congressional Budget Office, a source that is publicly available. The CBO is
17 charged by Congress to forecast future economic activity for purposes of
18 determining the likely revenues and expenditures of the Federal Government.
19 This heavy responsibility conveys an obligation to produce the most reliable
20 predictions that sophisticated economic analysis can possibly produce. None of
21 the other sources – Blue Chip, the Energy Information Agency, the Social
22 Security Administration, Global Insights – bears this level of responsibility.

23
24 **Q. IS IT INCORRECT, AS DR. VANDERWEIDE ASSERTS, TO USE VALUE**
25 **LINE FORECASTS IN ESTIMATING THE "g" FACTOR IN THE DCF**
26 **FORMULA?**

27
28 A. No. Here, Dr. VanderWeide is being somewhat inconsistent. For his comparison
29 group selection he argues that more is better, and for his beta selection he insists

1 that Value Line is superior. But when it comes to the "g" factor, he strongly
2 recommends a single source, and that is I/B/E/S.

3
4 The reason for including Value Line forecasts has to do with the charge that has
5 been leveled at I/B/E/S and similar surveys of brokerage house analysts that they
6 are biased upward. The brokerage firms are in the business of buying and selling
7 stocks, and the argument is made that stocks trade more actively if it appears that
8 their earnings will increase at a rapid rate. Value Line, by contrast, does not buy
9 or sell stocks; it is purely an investment research firm. It has no incentive to
10 "highball" its earnings forecasts.

11
12 **Q. IS IT TRUE THAT THE STB USES MARKET VALUE CAPITAL**
13 **STRUCTURES IN DETERMINING THE COST OF CAPITAL TO THE**
14 **RAILROADS?**

15
16 **A.** This statement is correct, but it has little relevance here. The use of market value
17 capital structures was justified by the Interstate Commerce Commission, the
18 STB's predecessor, on the grounds that most of the railroads' traffic is
19 unregulated.¹ That is not the case with electric utilities.

20
21 I should add that the STB is now reconsidering its cost of capital methodology in
22 light of objections that have been raised to the very high 15.18 percent return to
23 equity recently found for the year 2005.²

24
25 **Q. HAS THE FCC REJECTED THE DCF METHOD AND ADOPTED CAPM,**
26 **AS DR. VANDERWEIDE IMPLIES?**

¹ *Railroad Revenue Adequacy – 1988 Determination*, 6 I.C.C.2d 919, at 940 (1990).

² In written testimony dated December 8, 2006 and oral testimony to the STB commissioners on February 15, 2007 in Ex Parte No. 664, *Railroad Cost of Capital*, I recommended that recent developments justify the STB reconsidering its use of market value capital structures in finding the railroads' cost of capital.

1
2
3 A. No. In the *Virginia Arbitration Order*³ the Wireline Competition Bureau – not
4 the FCC itself – found that the DCF inputs provided by the parties in that case
5 were inadequate or inappropriate for purposes of finding the cost of capital to be
6 used prospectively by Verizon Virginia to provide Unbundled Network Elements
7 to Competitive Common Carriers. Because of these DCF data problems, it
8 adopted the CAPM results. The Bureau made no finding as to the superiority of
9 one methodology over the other. The last such finding was in the last FCC cost of
10 capital inquiry, when the Commission found CAPM inadequate compared to
11 DCF.

12
13 **CAPITAL ASSET PRICING MODEL**
14

15 **Q. WHAT DO AMERENUE'S COST OF CAPITAL WITNESSES HAVE TO**
16 **SAY ABOUT YOUR APPLICATION OF THE CAPITAL ASSET**
17 **PRICING MODEL ("CAPM")?**
18

19 A. They strongly object to my selection of the three inputs to the CAPM model: the
20 risk-free rate, the beta, and the total market return.
21

22 **Q. WHAT IS YOUR RESPONSE TO THESE OBJECTIONS?**
23

24 A. These witnesses illustrate the main point that I have made with regard to the
25 CAPM, which is that there is so much judgment involved in selecting the inputs
26 that a creative analyst can manipulate the results to fit any preconception of the
27 appropriate rate of return. I do not contend that my beta and my market return are
28 the ideal inputs into this model for the simple reason that there are no ideal inputs.

³ CC Docket No. 00-251, Memorandum Opinion and Order, DA 02-1731, July 17, 2002.

1 Nonetheless, my inputs are both tenable and consistent with the CAPM theory.
2 Yet, my results are at the other end of the rate-of-return spectrum from the results
3 derived by the AmerenUE witnesses.
4

5 Please note, incidentally, that I do not use my CAPM results in estimating
6 AmerenUE's rate of return. Arguably, the witnesses' objections to my CAPM
7 formulation are beside the point.
8

9 **Q. WHAT ARE THE WITNESSES' OBJECTIONS TO YOUR RISK-FREE**
10 **RATE?**
11

12 A. Ms. McShane observes that I use the long-term Treasury bond yield as of
13 December 1, 2006, and that rate has since increased. She complains that I have
14 not used the Blue Chip *Financial Forecast* prediction of 5.0 percent in 2007 and
15 5.2 percent in 2008.
16

17 **Q. WHAT IS YOUR RESPONSE TO THESE OBJECTIONS?**
18

19 A. The only objection that has any validity is that my interest rate is now out-dated.
20 As of the week ending February 9, 2007, the yield on 30-year Treasury bonds was
21 4.86 percent. I have rerun my CAPM application, and I find that substituting this
22 value as the risk-free rate raises the result from 9.08 percent to 9.11 percent. The
23 4.86 percent is the most current measure of a risk-free rate that is known and
24 measurable. The Blue Chip forecasts do not meet this criterion.
25

26 **Q. WHAT ARE THE WITNESSES' OBJECTIONS TO YOUR SELECTION**
27 **OF BETAS?**
28

1 A. They both object to my inclusion of the betas developed by Thomson Financial,
2 the same company that produces the I/B/E/S forecasts. They argue that
3 Thomson's betas are not adjusted for the tendency of betas to gravitate toward
4 1.0.
5

6 **Q. ARE THOMSON FINANCIAL'S BETAS ADJUSTED?**
7

8 A. Yes. Schedule CWK-SR-2 is a copy of an e-mail I received from Thomson
9 Financial describing the derivation of their betas. The final sentence states that
10 "(t)he reported beta (B) is the adjusted value of $0.35+0.685B$ (According to
11 Blume, 1971)." The reference to "Blume" is to an article titled "On the
12 Assessment of Risk" by Marshall E. Blume published in the March 1971 *Journal*
13 *of Finance*. In that article, Dr. Blume found that there is a tendency of the betas
14 of portfolios of stocks to trend toward the beta of the market, that is, toward 1.0.
15 Since that time, it has been the practice of some analysts of beta to "adjust" the
16 betas so that they avoid the counter-intuitive result of minus values. Minus values
17 of "unadjusted" betas arise when the stock fluctuates inversely with the market.
18

19 Assuming the propriety of adjusting betas for individual companies, it would
20 appear that the Thomson adjustment is more sophisticated than that of Value
21 Line. Value line simply adds .25 to the unadjusted beta, while Thomson adds .35
22 and then 68.5 percent of the unadjusted beta. In any case, it is clear that the
23 Thomson betas are adjusted.
24

25 **Q. WHAT ARE THE WITNESSES' OBJECTIONS TO YOUR MARKET**
26 **RETURN?**
27

28 A. I derive my market return by means of a simplified DCF analysis using market
29 forecasts from Value Line. Dr. VanderWeide objects that I do not perform the

1 quarterly compounding that he espouses, that I apply this approach to companies
2 that do not issue dividends, and that I use Value Line's forecast of capital
3 appreciation that uses a "normalized" price/earnings ratio. Ms. McShane objects
4 that the Value Line growth forecast is short-term and does not reflect long-term
5 expectations.
6

7 **Q. HOW DO YOU RESPOND TO THESE OBJECTIONS?**
8

9 A. I have already demonstrated that quarterly compounding is unnecessary and
10 inappropriate. Value Line's forecast of capital appreciation does not address
11 individual companies. Rather, it covers the entire market, which is the
12 appropriate basis for establishing the expected return to the total market. Value
13 Line's use of a "normalized" P/E ratio means that its capital appreciation forecast
14 is actually a forecast of earnings, which is the appropriate input to the DCF
15 model. Dr. VanderWeide's objection strengthens the validity of my application.
16

17 Finally, I do not understand Ms. McShane's objection. Value Line's appreciation
18 forecast is out three to five years. The earnings forecasts of the investment
19 analysts surveyed by I/B/E/S are generally in the same time frame. I doubt that
20 any investment analyst would venture an earnings forecast beyond five years.
21

22 **Q. MS MCSHANE PRESENTS A FORECAST OF THE EARNINGS**
23 **GROWTH OF S&P 500 STOCKS. IS HER FORECAST SUPERIOR TO**
24 **YOURS?**
25

26 A. Arguably, my forecast is superior because it covers a broader spectrum of
27 companies: 1,700 as opposed to 500. However, Ms. McShane's forecast is
28 thoroughly acceptable, and it demonstrates how the use of different, thoroughly
29 acceptable inputs can change the results of the CAPM application.

Subject: Beta Calculations

Beta Coefficients

The **beta** coefficient indicates how a stock's daily changes compare to the daily changes of the S&P 500. The abbreviation displayed next to the "Bta" label for stocks trading for less than a year, and for **betas** less than 0.4 and greater than 2.5.

In bullish markets, high **beta** stocks (**betas** greater than 1.00) tend to outperform the overall market. Likewise, in bearish r (**betas** less than 1.00) decline less than the general market.

If p_t^i represents the price of security i at time t (days), then the natural log of the price ratio

$Re_i = \ln(p_t^i / p_{t-1}^i)$ can be used as an approximation of the daily return on this security.

p_t^m represents the price of the S&P 500, and

$Re_m = \ln(p_t^m / p_{t-1}^m)$ represents the return (market return).

The B is the slope coefficient for the regression line formed by using Re_m as the independent variable and Re_i as the d
The **beta** coefficient is computed from data over the past seven years -- more than 1300 observations of daily price change
The reported **beta** (B) is the adjusted value of: $0.35 + 0.685B$ (according to Blume, 1971).
